## **I. INTRODUCTION**

---

This Preliminary Stormwater Pollution Prevention Plan has been prepared for the 17.89 acre River Knoll residential development, located in the Town and Village of Ossining, Westchester County New York (hereinafter referred to as the "Site"). The site is bounded by Croton Dam Road to the west and residential properties to the north, south and east. The development has been designed in accordance with the following:

- Requirements of the New York State Department of Environmental Conservation (NYSDEC) SPDES General Permit No. GP-0-20-001, effective January 2020.
- Chapter 168 "Stormwater Management and Sediment and Erosion Control" of the Town of Ossining Code.

Hudson Park Group LLC proposes to construct 98 age-restricted townhouse units at the former Stony Lodge Psychiatric Hospital property. The proposed development will include the demolition of existing buildings and driveways and construct townhouse buildings with associated driveways, retaining walls, surface parking areas and landscaping. The proposed development will require the use of two infiltration basins to mitigate the stormwater runoff from the site.

## **II. STORMWATER MANAGEMENT PLANNING**

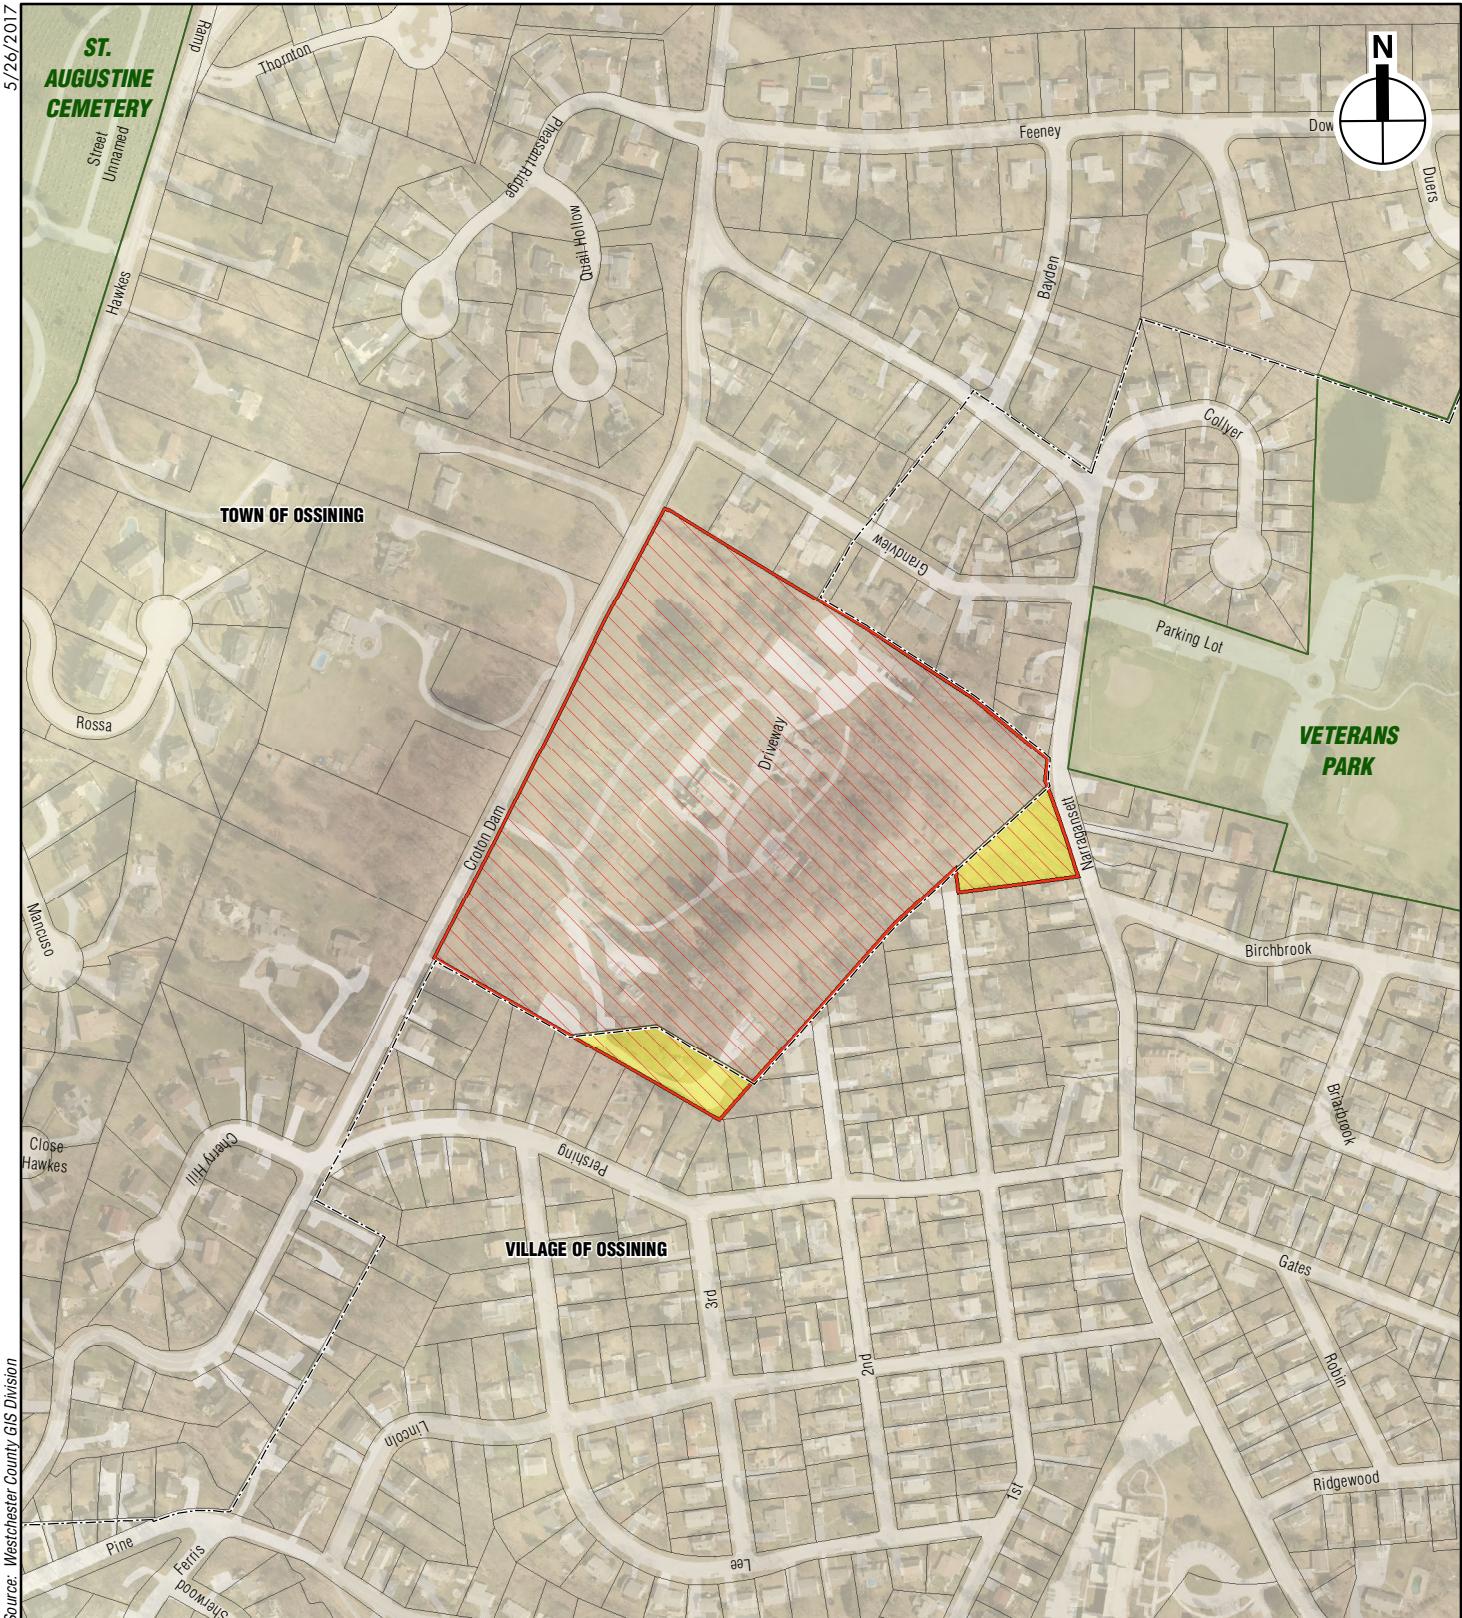

---

In order to be eligible for coverage under the NYSDEC SPDES General Permit No. GP-0-20-001 for Stormwater Discharges from Construction Activities, the Stormwater Pollution Prevention Plan (SWPPP) includes stormwater management practices (SMP's) from the publication "New York State Stormwater Management Design Manual," last revised January 2015.

A Stormwater Pollution Prevention Plan has been prepared for this project because it is a construction activity that involves:

- A construction activity that involves soil disturbances of one (1) or more acres of land.

Project Site Location  
**Figure 1-1**

The proposed stormwater facilities have been designed such that the quantity and quality of stormwater runoff during and after construction are not adversely altered or are enhanced when compared to pre-development conditions.

Based on correspondence with the New York State Office of Parks, Recreation and Historic Places (OPRHP), the site does not contain, nor is it immediately adjacent to any properties listed on the State or National Register of Historic Places.

### **The Five Step Process for Stormwater Site Planning and Practice Selection**

Stormwater management using green infrastructure is summarized in the five step process described below. The five-step process was adhered to when developing this SWPPP. Information is provided in this SWPPP which documents compliance with the required process as follows:

#### **Step 1: Site Planning**

Implement planning practices that protect natural resources and utilize the hydrology of the site. Strong consideration must be given to reducing impervious cover to aid in the preservation of natural resources including protecting natural areas, avoiding sensitive areas and minimizing grading and soil disturbance.

#### **Step 2: Determine Water Quality Treatment Volume (WQv)**

Determine the required WQv for the site based on the site layout, impervious areas and sub-catchments. This initial calculation of WQv will have to be revised after green infrastructure techniques are applied. The following method has been used to calculate the WQv.

- **90% Rule** - According to the New York State Stormwater Design Manual, Section 4.1, the water quality volume is determined from the 90% rule. The method is based on 90%

of the average annual stormwater runoff volume which must be provided due to impervious surfaces. The Water Quality Volume (denoted as the WQv) is designed to improve water quality sizing to capture and treat 90% of the average annual stormwater runoff volume. The WQv is directly related to the amount of impervious cover created at a site. The average rainfall storm depth for 90% of storms in New York State in one year is used to calculate a volume of runoff. The rainfall depth depends on the location of the site within the state. From this depth of rainfall, the required water quality volume is calculated.

The project is a redevelopment and therefore will comply with the strategies outlined within Chapter 9: Redevelopment Projects of the Design Manual. There are different options to control water quality depending on the redevelopment.

Since the redevelopment results in the creation of additional impervious area, Water Quality Treatment Option II will be utilized which requires treatment for 25% of the existing impervious area, plus 100% of the additional, new impervious area.

The plan proposes that a minimum of 25% of the water quality volume (WQv) from the disturbed area is captured and treated by the implementation of standard practices. When utilizing structural stormwater management practices, these practices should be targeted to treat areas with the greatest pollutant generation potential (e.g. parking areas, service stations, etc).

The NYSDEC Redevelopment Standards include specific criteria for the implementation of surface water quality improvements. A combination of standard and non-standard practices are proposed and all facilities will treat the required water quality volume from the entire contributing area. Therefore, Water Quality Treatment Options II & III will be utilized. According to Option III of the Redevelopment Standards, alternative or non-standard practices such as manufactured treatment devices are acceptable if they treat 75% of the water quality volume from the disturbed areas as well as any additional runoff directed to the practice. According to Option II, standard practices such as subsurface infiltration systems can be sized to treat the water quality volume generated from 25% of the existing impervious area plus 100% of the new impervious area.

Green practices such as green roofs and porous pavement can be used towards credit in meeting the water quality volume requirements.

Proposed standard SMP's will effectively treat 100% of the Water Quality Volume (Wqv) for all existing and new impervious areas and the proposed alternative SMP will treat a portion of the redevelopment area.

#### Step 3: Runoff Reduction Volumes (RRv) by Applying Green Infrastructure Techniques and Standard SMP's

RRv is required for this project since it is a combination of both new development and redevelopment.

Green infrastructure techniques or standard SMP's with RRv capacity can potentially reduce the required WQv by incorporating combinations of green infrastructure techniques and standard SMP's within each drainage area on the site.

Green infrastructure techniques are grouped into two categories:

- Practices resulting in a reduction of contributing area such as preservation/restoration of conservation areas, vegetated channels, etc.
- Practices resulting in a reduction of contributing volume such as green roofs, stormwater planters, and rain gardens.

Apply a combination of green infrastructure techniques and standard SMPs with RRv capacity to provide 100% of the WQv calculated in Step 2. If the RRv calculated in this step is greater than or equal to the WQv in Step 2, the RRv requirement has been met and Step 4 can be skipped. If the RRv provided cannot meet or exceed 100% of the WQv, the project must, at a minimum, reduce a percentage of the runoff from impervious areas to be constructed on the site. The percent reduction is based on the Hydrologic Soil Group(s) (HSG) of the site and is defined as Specific Reduction Factor (S).

The Minimum RRv capacity required must be provided by green infrastructure techniques to verify that the RRv requirement has been met. The RRv that is provided by the green infrastructure techniques can then be subtracted from the Total Required WQv that must be provided by the SMP's.

#### Step 4: Apply Standard Stormwater Management Practices to Address Remaining Water Quality Volume

Apply the standard SMP's to meet additional water quality volume requirements that cannot be addressed by applying the green infrastructure techniques. The standard SMP's with RRv capacity must be implemented to verify that the RRv requirement has been met.

- **Infiltration Practices** – A subsurface infiltration system is proposed to treat and retain runoff from the site. This practice is located in an area where the groundwater elevation is acceptable to provide the required separation. According to Section 3.6 of the Design Manual, 90% of the WQv provided by an Infiltration Practice can be applied towards meeting the RRv criteria.

#### Step 5: Apply Volume and Peak Rate Control Practices to Meet Water Quantity Requirements

The Channel Protection Volume (CPv), Overbank Flood Control (Qp) and Extreme Flood Control (Qf) must be met for the plan to be completed. This is accomplished by using practices such as infiltration basins, dry detention basins, etc. to meet water quantity requirements. The following standards must be met:

##### **1. Stream Channel Protection (CPv)**

Stream Channel Protection Volume Requirements (CPv) are designed to protect stream channels from erosion. In New York State this goal is accomplished by providing 24-hour extended detention of the one-year, 24-hour storm event, remained from runoff reduction. Reduction of runoff for meeting stream channel protection objectives, where

site conditions allow, is encouraged and the volume reduction achieved through green infrastructure can be deducted from CPv. Trout waters may be exempted from the 24-hour ED requirement, with only 12 hours of extended detention required to meet this criterion. Detention time may be calculated using either a center of mass method or plug flow calculation method.

- CPv is not required because reduction of the entire CPv volume is achieved at a site through green infrastructure or infiltration systems.

## **2. Overbank Flood (Qp) which is the 10 year storm.**

Overbank control requires storage to attenuate the post development 10-year, 24-hour peak discharge rate (Qp) to predevelopment rates.

The overbank flood control requirement (Qp) does not apply in certain conditions, including:

- The site discharges directly tidal waters or fifth order (fifth downstream) or larger streams.
- A downstream analysis reveals that overbank control is not needed.
- If redevelopment results in no increase in impervious area or changes to hydrology that increase the discharge rate from the site, the ten year criteria does not apply.

## **3. Extreme Storm (Qf) which is the 100 year storm.**

100 Year Control requires storage to attenuate the post development 100-year, 24-hour peak discharge rate (Qf) to predevelopment rates.

The 100-year storm control requirement can be waived if:

- The site discharges directly tidal waters or fifth order (fifth downstream) or larger streams.
- Development is prohibited within the ultimate 100-year floodplain
- A downstream analysis reveals that 100-year control is not needed.
- If redevelopment results in no increase in impervious area or changes to hydrology that increase the discharge rate from the site the hundred-year criteria does not apply.

Based on the foregoing, this project is eligible for coverage under NYSDEC SPDES General Permit No. GP-0-20-001.

### **III. STUDY METHODOLOGY**

---

Runoff rates were calculated based upon the standards set forth by the United States Department of Agriculture Natural Resources Conservation Service Technical Release 55, Urban Hydrology for Small Watersheds (TR-55), dated June 1986. The methodology set forth in TR-55 considers a multitude of characteristics for watershed areas including soil types, soil permeability, vegetative cover, time of concentration, topography, rainfall intensity, ponding areas, etc.

The 1, 10, 100 year storm recurrence intervals were reviewed in the design of the stormwater management facilities (see Appendices A & B Existing/Proposed Hydrologic Calculations).

Anticipated drainage conditions were analyzed taking into account the rate of runoff which will result from the construction of buildings, parking areas and other impervious surfaces associated with the site development.

## Base Data and Design Criteria

For the stormwater management analysis, the following base information and methodology were used:

1. The site drainage patterns and outfall facilities were reviewed by JMC personnel for the purpose of gathering background data and confirming existing mapping of the watershed areas.
2. An Existing Drainage Area Map was developed from the topographical survey. The drainage area map reflects the existing conditions within and around the project area.
3. A Proposed Drainage Area Map was developed from the proposed grading design superimposed over the topographical survey. The drainage area map reflects the proposed conditions within the project area and the existing conditions to remain in the surrounding area.
4. The United States Department of Agriculture (USDA) Web Soil Survey of the site available on its website at <http://websoilsurvey.nrcd.usda.gov>.
5. Soil Survey of Putnam and Westchester Counties, 1994.
6. The United States Department of Agriculture Natural Resources Conservation Service Technical Report No. 55, Urban Hydrology for Small Watersheds (TR-55), dated June 1986.

The time of concentration was calculated using the methods described in Chapter 3 of TR-55, Second Edition, June 1986. Manning's kinematics wave equation was used to determine the travel time of sheet flow. The 2-year 24-hour precipitation amount of 3.41 inches was used in the equation for all storm events. The travel time for shallow concentrated flow was computed using Figure 3-1 and Table 3-1 of TR-55. Manning's Equation was used to determine the travel time for channel reaches.

7. All hydrologic calculations were performed with the Bentley PondPack software package version 10.0.
8. The New York State Stormwater Management Design Manual, revised January 2015.
9. New York Standards and Specifications for Erosion and Sediment Control, November 2016.
10. The storm flows for the 1, 10, & 100 year recurrence interval storms were analyzed for the total watershed areas. The Type III distribution design storm for a 24 hour duration was used and the mass rainfall for each design storm was taken from the Extreme Precipitation in New York & New England developed by the Natural Resource Conservation Service (NRCS) and the Northeast Regional Climate Center (NRCC) as follows:

#### **24 Hour Rainfall Amounts**

Design Storm Recurrence Interval	Inches of Rainfall
1 Year	<b>2.78</b>
10 Year	<b>5.14</b>
100 Year	<b>9.30</b>

<http://precip.eas.cornell.edu/>

---

#### **IV. EXISTING CONDITIONS**

The existing conditions of the project site consists of the vacant stony lodge psychiatric facility, which contains existing buildings, driveways, grass and wooded areas. Stormwater from the site flows southeast and southwest to existing storm sewer structures that lead off site. After stormwater runoff exits the project site, it flows to existing stormwater conveyance systems in Pershing Avenue.

The following natural features, conservation areas, resource areas and drainage patterns of the project site have been identified and utilized to develop Drawing DA-1 “Existing Drainage Area Map” which is included in Appendix H:

- Vegetative cover
- Critical areas
- Topography (contour lines, existing flow paths, steep slopes, etc.)
- Soil (hydrologic soil groups, highly erodible soils, etc.)
- Bedrock, significant geology features

Based on the USDA web soil survey, all on-site soils are well drained and belong to hydrological group(s) B, C and D. The soil types, boundaries and drainage areas/designations are depicted on Drawing DA-1 within Appendix H.

Three (3) separate Design Points (1 through 3) were identified for comparing peak rates of runoff in existing and proposed conditions. Three (3) separate drainage areas were identified in existing conditions based on the existing drainage divides at the site. The numbers included in the name of each drainage area correspond to the Design Point they drain towards.

The following is a description of each of the drainage areas analyzed in the existing conditions analysis:

Existing Drainage Area 1 is the western portion of the site and discharges to Design Point 1, which is an existing catch basin located in Pershing Avenue. Existing Drainage Area 1 consists of the following sub-drainage areas:

Existing Drainage Area 1A (EDA-1A) is 2.60 acres in size and is located in the north corner of the site adjacent to Croton Dam Road. This area consists of parking areas, driveways, woods and grassed areas. This drainage area initially drains northwest towards an existing depression which acts as a small detention pond and drains south adjacent to croton dam road towards design point one. The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 69 and

14.3 minutes, respectively. Refer to Drawing DA-1 in Appendix H.

Existing Drainage Area 1B (EDA-1B) is 2.31 acres and consist of a portion of the main building, an asphalt parking area, asphalt drives, woods and grass. Runoff from EA-1B flows overland to a depression to the north of the site driveway. The runoff is collected by a drain inlet in the depression and conveyed in a 12" corrugated metal pipe (CMP) to EDA-1C.

The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 74 and 11.4 minutes, respectively. Refer to Drawing DA-1 in Appendix H.

Existing Drainage Area 1C (EDA-1C) is 3.51 acres and consists of a portion of the main building, a 2 story frame building, asphalt drives, a gravel parking area, a few utility buildings, woods and grass. Runoff from EDA-1C flows overland to the southeast corner of the site. The runoff at this location is routed through an existing pipe that extends through the neighboring properties and into the existing catch basin in Pershing Avenue. The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 75 and 8.8 minutes, respectively. Refer to Drawing DA-1 in Appendix H.

Existing Drainage Area 2 is the eastern portion of the site and discharges to Design Point 2, which is an existing structure in the southernmost corner of the site. Existing Drainage Area 2 consists of the following sub-drainage areas:

Existing Drainage Area 2A (EDA-2A) is 2.99 acres and consists of a garage and recreation building, a portion of the North Lodge, asphalt parking areas, asphalt drives, woods and grass. Runoff from EDA-2 flows overland to a wetland in the Village of Ossining. The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 69 and 5.9 minutes, respectively. Refer to Drawing DA-1 in Appendix H.

Existing Drainage Area 2B (EDA-2B) is 5.79 acres and consists of a portion of the North Lodge, the East Lodge, the West Lodge, the South Cottage, the Administration Building, a garage, a 1 ½ story frame building, asphalt walks and drives, woods and grass. Runoff from EDA-2B flows overland to a swale along the rear property line. The Curve Number (CN) and Time of

Concentration (Tc) for this drainage area are 67 and 12.1 minutes, respectively. Refer to Drawing DA-1 in Appendix H.

Existing Drainage Area 3 (EDA-3) is 0.09 acres and consists of a portion of the asphalt drive and grass area adjacent to Croton Dam Road. Runoff from EDA-3 flows overland out to Croton Dam Road. The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 80 and 5 minutes, respectively. Refer to Drawing DA-1 in Appendix H.

The peak rates of runoff to the design points from the drainage areas for each storm are shown in the table below:

**Table 1**  
**Summary of Peak Rates of Runoff in Existing Conditions**  
(Cubic Feet per Second)

Storm Recurrence Interval	DP-1	DP-2	DP-3
1 year	3.65	3.21	0.21
10 year	12.59	15.40	0.39
100 year	26.73	42.32	2.28

## V. PROPOSED CONDITIONS

---

The proposed improvements consist of 98 age-restricted townhouse units including 18 affordable units in clusters of 2, 3, 4, 5 and 6 units, associated sidewalks, parking lot, driveway, subsurface parking garage and landscaped areas. The proposed on-site stormwater runoff from the impervious surfaces including building rooftops, driveway, parking areas and sidewalks will be collected and conveyed by drainage manholes and catch basins to a network of high density polyethylene (HDPE) drain pipe installed underground with discharge to proposed infiltration basins and a micropool extended detention basin.

The proposed drainage improvements include standard stormwater management practices, such as infiltration basins. The vegetated practices and overland discharges provide multiple opportunities for water quality enhancement and infiltration in addition to the proposed stormwater management practices.

This section describes the design and analysis of the proposed conditions used to demonstrate that the SWPPP meets the requirements of the General Permit.

### **The Five Step Process For Stormwater Site Planning and Practice Selection**

#### **Step 1: Site Planning**

The following practices and site features were incorporated in the site design:

- Forest, vegetative cover – The maximum amount of forest and vegetative cover has been maintained and/or provided.
- Topography (contour lines, existing flow paths, steep slopes, etc.) has been maintained or disturbed to the minimum extent practicable.
- Soil (hydrologic soil groups, highly erodible soils, etc.)
- Bedrock, significant geology features have been accounted for.

#### **Step 2: Determine Water Quality Treatment Volume (WQv)**

This initial calculation of WQv must be revised after green infrastructure techniques are applied. The following method has been used to calculate the WQv.

**90% Rule** - According to the New York State Stormwater Design Manual, Section 4.1, the water quality volume is determined by the 90% rule. The method is based on 90% of the average annual stormwater runoff volume which must be provided due to impervious surfaces. The WQv is directly related to the amount of impervious cover created at a site. The rainfall depth depends on the location of the site within the state. From this depth of rainfall, the required water quality volume is calculated.

#### **Step 3: Runoff Reduction Volumes (RRv) by Applying Green Infrastructure Techniques and Standard SMP's**

Handling of the Runoff Reduction Volume (RRv) is required for the project since it is new development. As permitted in the NYS Stormwater Design Manual, green infrastructure techniques and standard stormwater management practices with RRv capacity can be credited towards the required WQv discussed above when implemented in accordance with the Manual.

Green infrastructure techniques are grouped into two categories:

- Practices resulting in a reduction of contributing area such as preservation/restoration of conservation areas, tree planting, riparian buffers, etc.
- Practices resulting in a reduction of contributing volume such as vegetated swales, pervious pavers, bioretention systems and infiltration systems.

Apply a combination of green infrastructure techniques and standard SMPs with RRv capacity to provide 100% of the WQv calculated in Step 2. If the RRv calculated in this step is greater than or equal to the WQv in Step 2, the RRv requirement has been met and Step 4 can be skipped. If the RRv provided cannot meet or exceed 100% of the WQv, the project must, at a minimum, reduce a percentage of the runoff from impervious areas to be constructed on the Site which is referred to as the Minimum RRv. The percent reduction is based on the Hydrologic Soil Group(s) (HSG) of the Site and is defined as Specific Reduction Factor.

The following standard stormwater management practice is provided in the Design Manual:

- **Standard Practices with RRv Capacity**
  - **Infiltration Basins** – Two infiltration systems are proposed to treat and retain runoff from the rooftop of the proposed building, parking areas, driveways and sidewalks. These practices are located in areas where the existing groundwater was identified at a lower depth.

The Minimum RRv capacity required must be provided by green infrastructure techniques or standard practices to verify that the RRv requirement has been met. The RRv that is provided by

the green infrastructure techniques can then be subtracted from the Total Required WQv that must be provided by the SMP's.

Step 4: Apply Standard Stormwater Management Practices to Address Remaining Water Quality Volume

The standard SMP's must be designed to meet additional water quality volume requirements that cannot be addressed by applying the green infrastructure techniques by themselves.

Step 5: Apply Volume and Peak Rate Control Practices to Meet Water Quantity Requirements

All practices exceed the required elements of SMP criteria as outlined in Chapter 6 of the NYS Stormwater Management Design Manual. A summary of each category is provided below.

1. Feasibility – Ponds are designed based upon unique physical environmental considerations noted in the NYS Stormwater Management Design Manual (NYSSMDM) Table 7.2 "Physical Feasibility Matrix".
2. Conveyance – The design conveys runoff to the designed pond in a manner that is safe, minimizes erosion and disruption to natural drainage channel and promotes filtering and infiltration.
3. Pretreatment – All pond provide pretreatment in accordance with NYSSMDM design guidelines.
4. Treatment Geometry – The plan provides water quality treatment in accordance with NYSSMDM guidelines noted Table 6.1 "Water Quality Volume Distributing in Pond Design".
5. Environmental/Landscaping –Extensive landscaping has been provided for each proposed practice to enhance pollutant removal and provide aesthetic enhancement to the property.
6. Maintenance – Maintenance for the environment practices has been provided and is detail in the SWPPP Report as required. Maintenance access is provided in the design plans.

Table 1 summarizes the WQv and RRv required for both design points on the property:

**Table 1**

<b>WQv / RRv Calculations Summary – See Appendix C</b>	
Initial Required WQv	47,571 c.f.
Adjusted Required WQv (Redevelopment)	37,182 c.f.
Minimum RRv Required	12,250 c.f.
RRv Provided	43,308 c.f.
Net WQv Required	0 c.f.

In order to determine the post-development rates of runoff generated on-site, the following drainage areas were analyzed in the post-development conditions. These areas are graphically depicted on Drawing DA-2 "Proposed Drainage Area Map" located in Appendix H.

Three separate Design Points were identified for comparing peak rates of runoff in existing and proposed conditions. Similarly, three separate drainage areas were identified in proposed conditions based on the proposed drainage divides at the site. The numbers included in the name of each drainage area correspond to the Design Point they drain towards.

The following is a description of each of the drainage areas analyzed in the proposed conditions analysis.

Proposed Drainage Area 1 is the western portion of the site and discharges to Design Point 1, which is an existing catch basin located in Pershing Avenue. Proposed Drainage Area 1 consists of the following sub-drainage areas:

Proposed Drainage Area 1A (PDA-1A) is 6.08 acres located at the northwestern portion of the site and consist of the proposed townhouses, driveways, parking areas and landscaping areas. Runoff from PDA-1A will be collected by roof drain leaders and drain inlets and conveyed in pipes to infiltration basin 1A. Stormwater runoff will be pretreated prior to discharging into the infiltration basin with the use of a Cascade Separator water quality structure. The treated water from the

Cascade unit will be routed to the infiltration basin 1A. Multiple infiltration tests were conducted in the area comprising the stormwater basin and revealed infiltration rates ranging from 2-12 inches per hour. To provide a conservative analysis, the average 5 inches per hour was utilized in all infiltration calculations. The outflow for the from the infiltration basin will be conveyed by the outlet control structure OCS-1A which consist of a 3" orifice at elevation 358.75, a 4' weir at elevation 362.20 and the grate top set at elevation 363.10. A 15" culvert pipe is proposed to route the stormwater runoff to the Design Point 1. The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 77 and 5 minutes, respectively.

Proposed Drainage Area 1B (PDA-1B) is 5.82 acres located at the central western portion of the site and consists of a portion of the proposed townhouses, asphalt parking areas, asphalt drives and adjacent landscape areas. Runoff from PDA-1B will be collected by roof drain leaders and drain inlets and conveyed in pipes to infiltration basin 1B. Stormwater runoff will be pretreated prior to discharging into the infiltration basin with the use of a Cascade Separator water quality structure. The treated water from the Cascade unit will be routed to the infiltration basin 1B. Multiple infiltration tests were conducted in the area comprising the stormwater basin and revealed an average rate of 4 inches per hour that was utilized in all infiltration calculations. The outflow from the infiltration basin will be controlled by outlet control structure OCS-1 which consists of an 8" orifice at elevation 343.60 and the grate top set at elevation 347.10. A 15" pipe is proposed to route the stormwater runoff to the Design Point 1. The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 79 and 5 minutes, respectively.

Proposed Drainage Area 1C (PDA-1C) is 0.65 acres in size and consists southern area of the site remaining undeveloped that will continue to be routed through an existing pipe that extends through the neighboring properties and into the existing catch basin in Pershing Avenue. The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 76 and 5 minutes, respectively. Refer to Drawing DA-2 in Appendix H.

Proposed Drainage Area 1D (PDA-1D) is 1.40 acres and consists of the proposed clubhouse building, off street parking, driveway and adjacent landscape areas. Under proposed conditions the

total drainage area and total impervious have been reduced as compared to the existing conditions. Therefore, Water Quality Treatment Options II & III will be utilized. According to Option III of the Redevelopment Standards, alternative or non-standard practices such as manufactured treatment devices are acceptable if they treat 75% of the water quality volume from the disturbed areas as well as any additional runoff directed to the practice. Therefore, the impervious areas will be treated with a Cascade Separator Unit CS-3, which is a NYSDEC approved alternative practice. Runoff from PDA-1D will flow overland to a depression located south of the site driveway. The outflow from the depression will be conveyed to a proposed series of pipes located in Croton Dam Road and then discharge into an existing catch basin in Pershing Avenue. The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 80 and 5 minutes, respectively.:.

Proposed Drainage Area 2A (PDA-2A) is 3.27 in size and located along the easter portion of the site. the drainage area consists of rear roof areas of three buildings, landscape areas and adjacent undisturbed areas. Under the proposed conditions the total drainage area and total impervious have been reduced as compared to the existing conditions. Therefore, Water Quality Treatment Options II & III will be utilized. According to Option III of the Redevelopment Standards, alternative or non-standard practices such as manufactured treatment devices are acceptable if they treat 75% of the water quality volume from the disturbed areas as well as any additional runoff directed to the practice. Therefore, the impervious areas will be treated with a Cascade Separator Unit CS-3, which is a NYSDEC approved alternative practice. Runoff from PDA-2A flows overland to the wetland in the northeast corner of the site, as in existing conditions. The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 70 and 5 minutes, respectively.

Proposed Drainage Area PDA-3A is 0.07 acres and consists of the same portion of the asphalt drive and grass area adjacent to Croton Dam Road as compared to existing conditions. Runoff from PDA-3A flows overland out to Croton Dam Road. The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 87 and 5 minutes, respectively. Refer to Drawing DA-2 in Appendix H.

The peak rates of runoff to the design point of each of the analyzed drainage areas for each storm are shown on the table below:

**Table 3**  
**Summary of Proposed Peak Rates of Runoff in Proposed Conditions**  
**(Cubic Feet per Second)**

<b>Storm Recurrence Interval</b>	<b>DP-1</b>	<b>DP-2</b>	<b>DP-3</b>
1 year	0.57	1.84	0.11
10 year	2.81	7.44	0.26
100 year	17.70	19.30	0.52

The reductions in peak rates of runoff from proposed to existing conditions are shown on the table below:

**Table 4**  
**Percent Reductions in Peak Rates of Runoff (Existing vs. Proposed Conditions)**  
**(Cubic Feet per Second)**

<b>Design Point</b>	<b>Storm Recurrence Frequency (Years)</b>	<b>Existing Peak Runoff Rate (cfs)</b>	<b>Proposed Peak Runoff Rate (cfs)</b>	<b>Percent Reduction (%)</b>
1	1 year	3.65	0.57	84
	10 year	12.59	2.81	77
	100 year	26.73	17.70	33
2	1 year	3.21	1.84	42
	10 year	15.40	7.44	51
	100 year	42.32	19.30	54
3	1 year	0.21	0.11	47
	10 year	0.39	0.26	33
	100 year	2.28	0.52	77

As demonstrated in Table 4, the proposed stormwater improvements will result in significant reductions of peak rates of runoff for all storms and design points analyzed.

## **VI. SOIL EROSION & SEDIMENT CONTROL**

---

A potential impact of the proposed development on any soils or slopes will be that of erosion and transport of sediment during construction. An Erosion and Sediment Control Management Program will be established for the proposed development, beginning at the start of construction and continuing throughout its course, as outlined in the "New York State Standards and Specifications for Erosion and Sediment Control," dated November 2016. A continuing maintenance program will be implemented for the control of sediment transport and erosion control after construction and throughout the useful life of the project.

The Operator shall have a qualified professional conduct an assessment of the site prior to the commencement of construction and certify that the appropriate erosion and sediment controls, as shown on the Sediment & Erosion Control Plans, have been adequately installed to ensure overall preparedness of the site for the commencement of construction. In addition, the Operator shall have a qualified professional conduct one site inspection at least every seven calendar days and at least two site inspections every seven calendar days when greater than five acres of soil is disturbed at any one time.

Prior to the commencement of construction activity, the owner or operator must identify the contractor(s) and subcontractor(s) that will be responsible for installing, constructing, repairing, replacing, inspecting and maintaining the erosion and sediment control practices included in the SWPPP; and the contractor(s) and subcontractor(s) that will be responsible for constructing the post-construction stormwater management practices included in the SWPPP. The owner or operator shall have each of the contractors and subcontractors identify at least one person from their company that will be responsible for implementation of the SWPPP. This person shall be known as the trained contractor. The owner or operator shall ensure that at least one trained contractor is on site on a daily basis when soil disturbance activities are being performed. The owner or operator shall have each of the contractors and subcontractors identified above sign a copy of the certification statement provided in Appendix H before they commence any construction activity.

## Soil Description

As provided by the United States Department of Agriculture, Soil Conservation Service "Web Soil Survey," soil classifications which exist on the subject site are described below.

Soils are placed into four hydrologic groups: A, B, C, and D. In the definitions of the classes, infiltration rate is the rate at which water enters the soil at the surface and is controlled by the surface conditions. Transmission rate is the rate at which water moves in the soil and is controlled by soil properties. Definitions of the classes are as follows:

- A. (Low runoff potential). The soils have a high infiltration rate even when thoroughly wetted. They chiefly consist of deep, well drained to excessively drained sands or gravels. They have a high rate of water transmission.
- B. The soils have a moderate infiltration rate when thoroughly wetted. They chiefly are moderately deep to deep, moderately well drained to well drained soils that have moderately fine to moderately coarse textures. They have a moderate rate of water transmission.
- C. The soils have a slow infiltration rate when thoroughly wetted. They chiefly have a layer that impedes downward movement of water or have moderately fine to fine texture. They have a slow rate of water transmission.
- D. (High runoff potential). The soils have a very slow infiltration rate when thoroughly wetted. They chiefly consist of clay soils that have a high swelling potential, soils that have a permanent high water table, soils that have a claypan or clay layer at or near the surface, and shallow soils over nearly impervious material. They have a very slow rate of water transmission.

A soil's tendency to erode is also described in the USDA web soil survey. The ratings in this interpretation indicate the hazard of soil loss from unsurfaced areas. The ratings are based on soil erosion factor K, slope, and content of rock fragments. The hazard is described as "slight,"

"moderate," or "SEVERE." A rating of "slight" indicates that little or no erosion is likely; "moderate" indicates that some erosion is likely, that the temporarily unsurfaced / unstabilized during construction may require occasional maintenance, and that simple erosion-control measures are needed; and "SEVERE" indicates that significant erosion is expected, that the roads or trails require frequent maintenance, and that erosion-control measures are needed.

Per the Soil Survey, the following soils listed below are present at the site. Following this list is a detailed description of each soil type found on the property:

<b>SYM.</b>	<b>HYDRO.</b>	<b>SOIL GROUP</b>	<b>DESCRIPTION</b>
ChE	B		<b>Charlton Loam, 25-35% slopes</b>
CsD	B		<b>Chatfield Charlton , very rocky</b>
HrF	D		<b>Hollis-Rock Outcrop Complex, very steep</b>
CrC	B		<b>Charlton Chatfield complex</b>
LcB	A/D		<b>Leicester Loam, 3-8% slopes</b>
PnD	C		<b>Paxton Fine Sandy Loam, 15-25% slopes</b>

#### On-Site Pollution Prevention

There are temporary pollution prevention measures used to control litter and construction debris on site, such as:

- Silt Fence
- Sediment Traps
- Inlet Protection

There will be inlet protection provided for all storm drains and inlets with the use of stone & block drop inlet protection, which keep silt, sediment and construction litter and debris out of the on-site stormwater drainage system.

#### Temporary Control Measures

Temporary control measures and facilities will include silt fences, interceptor swales, stabilized construction entrances, temporary seeding, mulching and sediment traps.

Throughout the construction of the proposed redevelopment, temporary control facilities will be implemented to control on-site erosion and sediment transfer. Interceptor swales, if required, will be used to direct stormwater runoff to temporary sediment traps for settlement. The sediment traps will be constructed as part of this project will serve as temporary sediment basins to remove sediment and pollutants from the stormwater runoff produced during construction.

Descriptions of the temporary sediment & erosion controls that will be used during the development of the site including silt fence, stabilized construction entrance, seeding, mulching and inlet protection are as follows:

1. Silt Fence is constructed using a geotextile fabric. The fence will be either 18 inches or 30 inches high. The height of the fence can be increased in the event of placing these devices on uncompacted fills or extremely loose undisturbed soils. The fences will not be placed in areas which receive concentrated flows such as ditches, swales and channels nor will the filter fabric material be placed across the entrance to pipes, culverts, spillway structures, sediment traps or basins.
2. Stabilized Construction Access consists of AASHTO No. 1 rock. The rock entrance will be a minimum of 50 feet in length by 20 feet in width by 8 inches in depth.
3. Seeding will be used to create a vegetative surface to stabilize disturbed earth until at least 70% of the disturbed area has a perennial vegetative cover. This amount is required to adequately function as a sediment and erosion control facility. Grass lining will also be used to line temporary channels and the surrounding disturbed areas.
4. Mulching is used as an anchor for seeding and disturbed areas to reduce soil loss due to storm events. These areas will be mulched with straw at a rate of 3 tons per acre such that the mulch forms a continuous blanket. Mulch must be placed after seeding or within 48 hours after seeding is completed.
5. Inlet Protection will be provided for all stormwater basins and inlets with the use of stone & block drop inlet protection structures, which will keep silt, sediment and construction debris

out of the storm system. Existing structures within existing paved areas will be protected using Manufactured Insert Inlet Protection inside the structures.

6. Erosion Control Matting will be utilized on slopes and within swales, where applicable, to provide stabilization in advance of vegetation being established. Such matting will be biodegradable to facilitate long term growth of vegetation in swales, on slopes and within stormwater management facilities.
7. Sediments Traps will be used with the permanent SMP's until their contributing areas are stabilized.

The contractor shall be responsible for maintaining the temporary sediment and erosion control measures throughout construction. This maintenance will include, but not be limited to, the following tasks:

1. For dust control purposes, moisten all exposed graded areas with water at least twice a day in those areas where soil is exposed and cannot be planted with a temporary cover due to construction operations or the season (December through March).
2. Inspection of erosion and sediment control measures shall be performed at the end of each construction day and immediately following each rainfall event. All required repairs shall be immediately executed by the contractor.
3. Sediment deposits shall be removed when they reach approximately  $\frac{1}{3}$  the height of the silt fence. All such sediment shall be properly disposed of in fill areas on the site, as directed by the Owner's Field Representative. Fill shall be protected following disposal with mulch, temporary and/or permanent vegetation and be completely circumscribed on the downhill side by silt fence.
4. Rake all exposed areas parallel to the slope during earthwork operations.

5. Following final grading, the disturbed area shall be stabilized with a permanent surface treatment (i.e. turf grass, pavement or sidewalk). During rough grading, areas which are not to be disturbed for fourteen or more days shall be stabilized with the temporary seed mixture, as defined on the plans. Seed all piles of dirt in exposed soil areas that will not receive a permanent surface treatment.

### Concrete Material and Equipment Management

Concrete washouts shall be used to contain concrete and liquids when the chutes of concrete mixers and hoppers of concrete pumps are rinsed out after delivery. The washout facilities consolidate solid for easier disposal and prevent runoff of liquids. The wash water is alkaline and contains high levels of chromium, which can leach into the ground and contaminate groundwater. It can also migrate to a storm drain, which can increase the pH of area waters and harm aquatic life. Solids that are improperly disposed of can clog storm drain pipes and cause flooding. Installing concrete washout facilities not only prevents pollution but also is a matter of good housekeeping at your construction site.

Prefabricated concrete washout containers can be delivered to the site to provide maintenance and disposal of materials. Regular pick-ups of solid and liquid waste materials will be necessary. To prevent leaks on the job site, ensure that prefabricated washout containers are watertight. A self installed concrete washout facility can be utilized although they are much less reliable than prefabricated containers and are prone to leaks. There are many design options for the washout, but they are preferably built below-grade to prevent breaches and reduce the likelihood of runoff. Above-grade structures can also be used if they are sized and constructed correctly and are diligently maintained. One of the most common problems with self-installed concrete washout facilities is that they can leak or be breached as a result of constant use, therefore the contractor shall be sure to use quality materials and inspect the facilities on a daily basis.

Washouts must be sized to handle solids, wash water, and rainfall to prevent overflow. Concrete Washout Systems, Inc. estimates that 7 gallons of wash water are used to wash one truck chute and 50 gallons are used to wash out the hopper of a concrete pump truck.

For larger sites, a below-grade washout should be at least 10 feet wide and sized to contain all liquid and solid waste expected to be generated in between cleanout periods. A minimum of 12-inches of freeboard must be provided. The pit must be lined with plastic sheeting of at least 10-mil thickness without holes or tears to prevent leaching of liquids into the ground. Concrete wash water should never be placed in a pit that is connected to the storm drain system or that drains to nearby waterways.

An above-grade washout can be constructed at least 10 feet wide by 10 feet long and sized to contain all liquid and solid waste expected to be generated in between cleanout periods. A minimum of 4-inches of freeboard must be provided. The washout structures can be constructed with staked straw bales or sandbags double-or triple lined with plastic sheeting of at least 10-mil thickness without holes or tears.

Concrete washout facilities shall not be located within 50 feet of storm drains, open ditches, or water bodies and should be placed in locations that allow for convenient access for concrete trucks. The contractor shall check all concrete washout facilities daily to determine if they have been filled to 75 percent capacity, which is when materials need to be removed. Both above-and below-ground self-installed washouts should be inspected daily to ensure that plastic linings are intact and sidewalls have not been damaged by construction activities. Prefabricated washout containers should be inspected daily as well as to ensure the container is not leaking or nearing 75 percent capacity. Inspectors should also note whether the facilities are being used regularly. Additional signage for washouts may be needed in more convenient locations if concrete truck operators are not utilizing them.

The washout structures must be drained or covered prior to predicted rainstorms to prevent overflows. Hardened solids either whole or broken must be removed and then they may be reused onsite or hauled away for recycling.

Once materials are removed from the concrete washout, a new structure must be built or excavated, or if the previous structure is still intact, inspect it for signs of weakening or damage

and make any necessary repairs. Line the structure with new plastic that is free of holes or tears and replace signage if necessary. It is very important that new plastic be used after every cleaning because pumps and concrete removal equipment can damage the existing liner.

#### Construction Site Chemical Control

The purpose of this management measure is to prevent the generation of nonpoint source pollution from construction sites due to improper handling and usage of nutrients and toxic substances, and to prevent the movement of toxic substances from the construction site.

Many potential pollutants other than sediment are associated with construction activities. These pollutants include pesticides; fertilizers used for vegetative stabilization; petrochemicals; construction chemicals such as concrete products, sealers, and paints; wash water associated with these products; paper; wood; garbage; and sanitary waste.

Disposal of excess pesticides and pesticide-related wastes should conform to registered label directions for the disposal and storage of pesticides and pesticide containers set forth in applicable Federal, State and local regulations that govern their usage, handling, storage, and disposal.

Pesticides should be disposed of through either a licensed waste management firm or a treatment, storage and disposal (TSD) facility. Containers should be triple-rinsed before disposal, and rinse waters should be reused as product.

Other practices include setting aside a locked storage area, tightly closing lids, storing in a cool, dry place, checking containers periodically for leaks or deterioration, maintaining a list of products in storage, using plastic sheeting to line the storage areas, and notifying neighboring property owners prior to spraying.

When storing petroleum products, follow these guidelines:

- Create a shelter around the area with cover and wind protection;
- Line the storage area with a double layer of plastic sheeting or similar material;

- Create an impervious berm around the perimeter with a capacity of 110 percent greater than that of the largest container;
- Clearly label all products;
- Keep tanks off the ground; and
- Keep lids securely fastened.

Post spill procedure information and have persons trained in spill handling on site or on call at all times. Materials for cleaning up spills should be kept on site and easily available. Spills should be cleaned up immediately and the contaminated material properly disposed of. Maintain and wash equipment and machinery in confined areas specifically designed to control runoff.

Thinner or solvents should not be discharged into sanitary or storm systems when cleaning machinery. Use alternative methods for cleaning larger equipment parts, such as high-pressure, high-temperature water washes, or steam cleaning. Equipment-washing detergents can be used, and wash water may be discharged into sanitary sewers if solids are removed from the solution first. (This practice should be verified with the local sewer authority.) Small parts can be cleaned with degreasing solvents, which can then be reused or recycled.

#### Solid Waste Management and Portable Sanitary Management

The purpose of this management measure is to prevent the potential for solid waste such as construction debris, trash, etc. from construction sites due to improper handling and storage. Debris and litter should be removed periodically from the BMP's and surrounding areas to prevent clogging of pipes and structures. All construction material shall be stored in designated staging areas. Roll-off containers shall be placed on site and all empty containers, construction debris and litter shall be placed in the containers.

Portable sanitary units may be utilized on-site or bathrooms will be provided within construction trailers. A sanitation removal company will be hired to pump/remove any sanitary waste. In the event that portable sanitary units are used and then cleaned after being emptied, the rinse water may not be disposed of to the storm drain system. It shall be contained for later disposal if it can't

be disposed of on-site. Remove paper and trash before cleaning the portable sanitary units. The portable sanitary units shall be located away from the storm drain system if possible. Provide over head cover for wash areas if possible. Maintain spill response material and equipment on site to eliminate the potential for contaminants and wash water from entering the storm drain system.

#### Permanent Control Measures and Facilities for Long Term Protection

Towards the completion of construction, permanent sediment and erosion control measures will be developed for long term erosion protection. The following permanent control measures and facilities have been proposed to be implemented for the project:

1. Infiltration Basins will be used to treat the runoff volume generated from the developed area and provide improvement to water quality control. The proposed basins will provide water quality for 90% of the average annual stormwater runoff volume. The water quality volume will be retained and higher storms will be released gradually. Refer to the water quality volume calculations, in Appendix C.
2. Catch Basins will be used to remove some of the coarse sand and grit sediment before entering the drainage system. Each catch basin will be constructed with an 18 inch deep sump.
3. Rip-Rap Energy Dissipators At discharge points from the stormwater drainage system into the stormwater management basins, rip-rap pads consisting of angular rocks will be placed to dissipate velocity and reduce the risk of erosion. The rip-rap pads will be 10 feet wide by 10 feet long.
4. Seeding of at least 70% perennial vegetative cover will be used to produce a permanent uniform erosion resistant surface. The seeded areas will be mulched with straw at a rate of 2 tons per acre such that the mulch forms a continuous blanket.

## **Specifications for Soil Restoration**

Prior to the final stabilization of the disturbed areas, soil restoration will be required for all vegetated areas to recover the original properties and porosity of the soil. Soil Restoration Requirements are provided on Table 7 below:

**Table 7**  
**Soil Restoration Requirements**

Type of Soil Disturbance	Soil Restoration Requirement		Comments/Examples
No soil disturbance	Restoration not permitted		Preservation of Natural Features
Minimal soil disturbance	Restoration not required		Clearing and grubbing
Areas where topsoil is stripped only – no change in grade	HSG A&B	HSG C&D	Protect area from any ongoing construction activities
	apply 6 inches of topsoil	Aerate* and apply 6 inches of topsoil	
Areas of cut or fill	HSG A&B	HSG C&D	Clearing and grubbing
	Aerate and apply 6 inches of topsoil	Apply full Soil Restoration**	
Heavy traffic areas on site (especially) in a zone 5-25 feet around buildings but not within a 5 foot perimeter around foundation walls)	Apply full Soil Restoration (decompaction and compost enhancement)		
Areas where Runoff Reduction and/or Infiltration practices are applied	Restoration not required, but may be applied to enhance the reduction specified for appropriate practices.		Keep construction equipment from crossing these areas. To protect newly installed practice from any ongoing construction activities construct a single phase operation fence area.
Redevelopment projects	Soil Restoration is required on redevelopment projects in areas where existing impervious area will be converted to pervious area.		

\* Aeration includes the use of machines such as tractor-drawn implements with coulters making a narrow slit in the soil, a roller with many spikes making indentations in the soil, or prongs which function like a mini-subsoiler.

\*\* Per "Deep Ripping and De-compaction, DEC 2008."

During periods of relatively low to moderate subsoil moisture, the disturbed subsoils are returned to rough grade and the following full soil restoration steps applied:

1. Apply 3 inches of compost over subsoil.
2. Till compost into subsoil to a depth of at least 12 inches using a cat-mounted ripper, tractor-mounted disc, or tiller, mixing, and circulating air and compost into subsoils.
3. Rock-pick until uplifted stone/rock materials of four inches and larger size are cleaned off the site.

#### **Specifications for Final Stabilization of Graded Areas**

Final stabilization of graded areas consists of the placement of topsoil and installation of landscaping (unless the area is to be paved, or a building is to be constructed in the location).

Topsoil is to be spread as soon as grading operations are completed. Topsoil is to be placed to a minimum depth of six inches on all embankments, planting areas and seeding/sod areas. The subgrade is to be scarified to a depth of two inches to provide a bond of the topsoil with the subsoil. Topsoil is to be raked to an even surface and cleared of all debris, roots, stones and other unsatisfactory material.

Planting operations shall be conducted under favorable weather conditions as follows:

- Permanent Lawns - April 15 (provided soil is frost-free and not excessively moist) to May 15; August 15 to October 15.
- Temporary Lawn Seeding - if outside of the time periods noted above, the areas shall be seeded immediately on completion of topsoil operations with annual ryegrass (Italian rye) at a rate of six pounds per 1,000 square feet. Temporary lawn installation is permitted provided the soil is frost-free and not excessively moist. The permanent lawn is to be installed the next planting season.

On slopes with a grade of 3 horizontal to 1 vertical or greater, and in swales, a geotextile netting or mat shall be installed for stabilization purposes as shown on the Plans. Seeded areas are to be mulched with straw or hay at an application rate of 70-90 pounds per 1,000 s.f. Straw or hay mulch must be spread uniformly and anchored immediately after spreading to prevent wind blowing. Mulches must be inspected periodically and in particular after rainstorms to check for erosion. If erosion is observed, additional mulch must be applied. Netting shall be inspected after rainstorms for dislocation or failure; any damage shall be repaired immediately.

All denuded surfaces which will be exposed for a period of over two months or more shall be temporarily hydroseeded with (a) perennial ryegrass at a rate of 40 lbs per acre (1.0 lb per 1000 square feet); (b) Certified "Aroostook" winter rye (cereal rye) @ 100 lb per acre (2.5 lb/1000 s.f.) to be used in the months of October and November.

Permanent turfgrass cover is to consist of a seed mixture as follows:

(a)           Sunny sites

Kentucky Bluegrass	2.0-2.6 pounds/1000 square feet
Perennial Ryegrass	0.6-0.7 pounds/1000 square feet
Fine Fescue	0.4-0.6 pounds/1000 square feet

(b)           Shady sites

Kentucky Bluegrass	0.8-1.0 pounds/1000 square feet
Perennial Ryegrass	0.6-0.7 pounds/1000 square feet
Fine Fescue	2.6-3.3 pounds/1000 square feet

All plant materials shall comply with the standards of the American Association Of Nurserymen with respect to height and caliper as described in its publication American Standard for Nursery Stock, latest edition.

## **VII. CONSTRUCTION PHASE AND POST-CONSTRUCTION MAINTENANCE**

During the construction phase and following construction of the project, a number of maintenance measures will be taken with respect to the site maintenance. Measures to be taken included the following:

### **1. During Construction**

A comprehensive sediment and erosion control plan will be in place during the construction period. Maintenance measures for sediment and erosion controls will include:

A qualified professional acceptable to the municipality will be hired by the owner or operator to monitor the installation and maintenance of the sediment and erosion control plans. The qualified professional shall report directly to the Engineering Consultant and shall be responsible for ensuring compliance with the design of the sediment and erosion control plans.

The qualified professional so hired will inspect all sediment and erosion control measures at least every seven calendar days. In the event that there has been a variance with the design of the sediment and erosion control measures so that the ability of the measures to adequately perform the intended function is lessened or compromised and/or the facilities are not adequately maintained, the qualified professional shall be required to report such variance to the Engineering Consultant within 48 hours and shall be empowered to order immediate repairs to the sediment and erosion control measures.

The qualified professional will also be responsible for observing the adequacy of the vegetation growth (trees, shrubs, groundcovers and turfgrasses) in newly graded areas and for ordering additional plantings in the event that the established plant materials do not adequately protect the ground surface from erosion.

## **2. Following Construction**

Site maintenance activities on the property will include:

- Grounds maintenance, including mowing of lawns;
- Planting of trees, shrubs and groundcovers; pruning of trees and shrubs;
- Application of fertilizer and herbicides;
- Maintenance of stormwater management area;

Grounds maintenance on the site will be performed by landscaping contractor.

Fertilizer is typically applied twice in the year - once in the spring and once in the fall. The application of fertilizer is usually necessary to maintain healthy lawn growth due to competition for nutrients with trees and shrubs and since the clippings are often removed. It is not recommended that fertilizer be applied during the summer. It is at this time that lawns are typically dormant.

Fertilizers come in three basic types: (1) Organic; (2) Soluble synthetic and (3) Slow release.

Organic fertilizers are derived from plant or animal waste. Since they are heavier and bulkier than other fertilizers, it is necessary to apply a much greater amount at one time. Soluble synthetic fertilizers are predictable with determining the exact impact on a lawn. However more applications are necessary since their effect is often short term. Slow release fertilizers have a high percentage of nitrogen so quantities that need be handled at one time are smaller. Slow release fertilizers will be utilized by the project.

A complete fertilizer contains all three of the primary nutrients - nitrogen (N), phosphorus (P) and potassium in the form of potash (K). Typically, a 3-1-2 ratio of nutrients (N-P-K) is used for lawn applications.

Fertilizer shall be applied by the landscape contractor in accordance with the manufacturer's instructions. The application of fertilizer does require some skill on the part of the operator. Should there be a spill of fertilizer, the landscape contractor shall be required to scrape or vacuum it up. The area will then be watered in accordance with the manufacturer's instructions to ensure that the fertilizer becomes soluble and available to plants and does not run off.

Hudson Park Group LLC will be responsible for the long-term operation and maintenance of the permanent stormwater management practices. The permanent stormwater management practices shall be maintained in accordance with the Maintenance Inspection Checklists provided in Appendix E.

## VIII. CONCLUSION

---

This Preliminary Stormwater Pollution Prevention Plan has been prepared to describe the project's pre and post-development stormwater management improvements and its sediment and erosion control improvements to be utilized during construction. The proposed permanent improvements and the interim improvements to be utilized during construction have been designed in accordance with the requirements of the:

- New York State Department of Environmental Conservation (NYSDEC) SPDES General Permit No. GP-0-20-001, effective January 2020.
- Chapter 168 "Stormwater Management and Sediment and Erosion Control" of the Town of Ossining Code.
- New York State Stormwater Management Design Manual, revised January 2016.

The project employs a variety of practices to enhance stormwater quality and reduce peak rates of runoff associated with the proposed improvements. These measures include infiltration basins, a wet extended detention pond and stormwater planters. These improvements will also mitigate runoff volumes from the proposed improvements as runoff volumes will be slightly reduced or maintained in all the analyzed storms.

Based on the foregoing, it is our professional opinion that the proposed improvements will provide water quantity and quality enhancements which exceed the above mentioned requirements and are not anticipated to have any adverse impacts to the site or any surrounding areas.

## **I. INTRODUCTION**

---

This Preliminary Stormwater Pollution Prevention Plan has been prepared for the 17.89 acre River Knoll residential development, located in the Town and Village of Ossining, Westchester County New York (hereinafter referred to as the "Site"). The site is bounded by Croton Dam Road to the west and residential properties to the north, south and east. The development has been designed in accordance with the following:

- Requirements of the New York State Department of Environmental Conservation (NYSDEC) SPDES General Permit No. GP-0-20-001, effective January 2020.
- Chapter 168 "Stormwater Management and Sediment and Erosion Control" of the Town of Ossining Code.

Hudson Park Group LLC proposes to construct 98 age-restricted townhouse units at the former Stony Lodge Psychiatric Hospital property. The proposed development will include the demolition of existing buildings and driveways and construct townhouse buildings with associated driveways, retaining walls, surface parking areas and landscaping. The proposed development will require the use of two infiltration basins to mitigate the stormwater runoff from the site.

## **II. STORMWATER MANAGEMENT PLANNING**

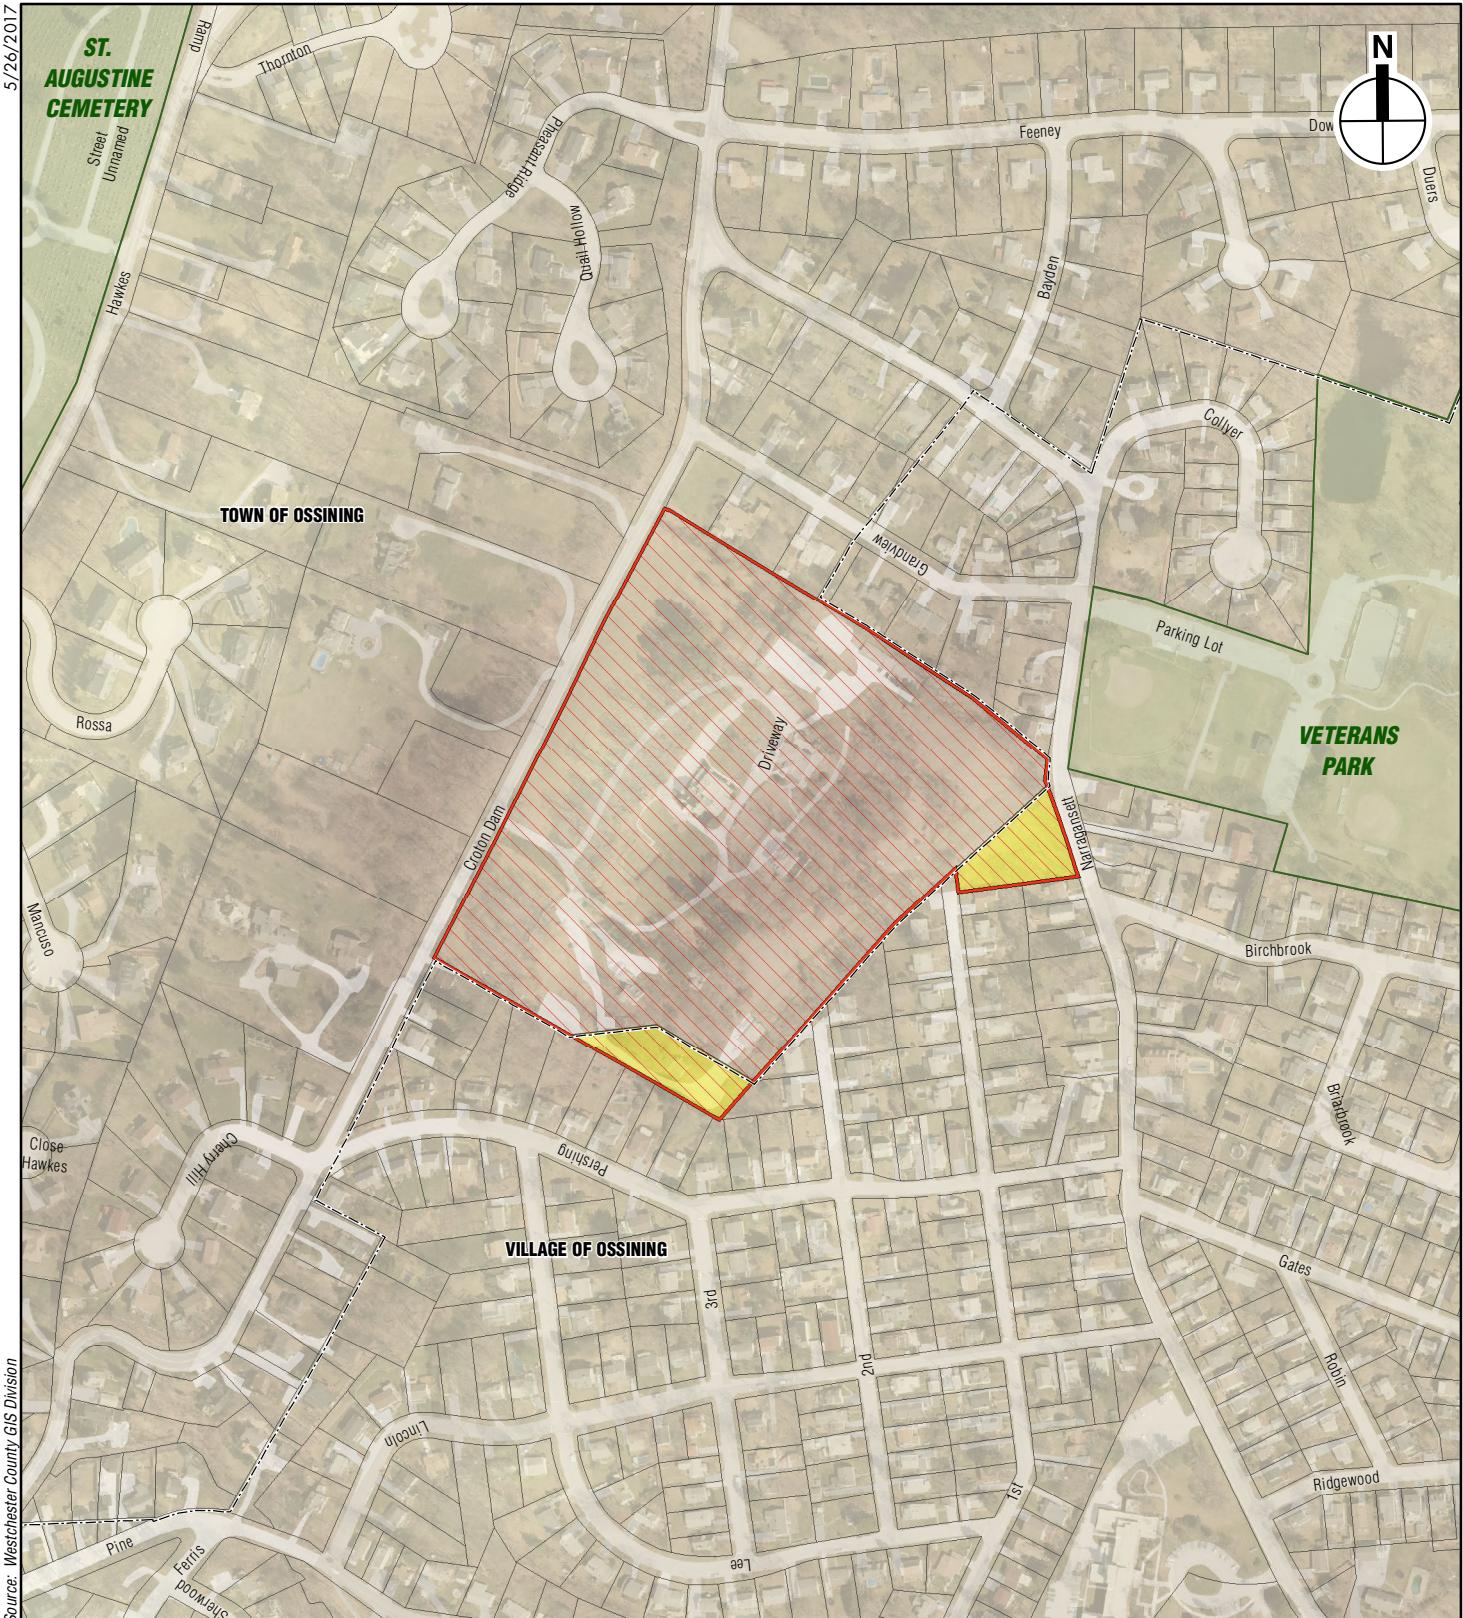

---

In order to be eligible for coverage under the NYSDEC SPDES General Permit No. GP-0-20-001 for Stormwater Discharges from Construction Activities, the Stormwater Pollution Prevention Plan (SWPPP) includes stormwater management practices (SMP's) from the publication "New York State Stormwater Management Design Manual," last revised January 2015.

A Stormwater Pollution Prevention Plan has been prepared for this project because it is a construction activity that involves:

- A construction activity that involves soil disturbances of one (1) or more acres of land.

5/26/2017

The proposed stormwater facilities have been designed such that the quantity and quality of stormwater runoff during and after construction are not adversely altered or are enhanced when compared to pre-development conditions.

Based on correspondence with the New York State Office of Parks, Recreation and Historic Places (OPRHP), the site does not contain, nor is it immediately adjacent to any properties listed on the State or National Register of Historic Places.

### **The Five Step Process for Stormwater Site Planning and Practice Selection**

Stormwater management using green infrastructure is summarized in the five step process described below. The five-step process was adhered to when developing this SWPPP. Information is provided in this SWPPP which documents compliance with the required process as follows:

#### **Step 1: Site Planning**

Implement planning practices that protect natural resources and utilize the hydrology of the site. Strong consideration must be given to reducing impervious cover to aid in the preservation of natural resources including protecting natural areas, avoiding sensitive areas and minimizing grading and soil disturbance.

#### **Step 2: Determine Water Quality Treatment Volume (WQv)**

Determine the required WQv for the site based on the site layout, impervious areas and sub-catchments. This initial calculation of WQv will have to be revised after green infrastructure techniques are applied. The following method has been used to calculate the WQv.

- **90% Rule** - According to the New York State Stormwater Design Manual, Section 4.1, the water quality volume is determined from the 90% rule. The method is based on 90%

of the average annual stormwater runoff volume which must be provided due to impervious surfaces. The Water Quality Volume (denoted as the WQv) is designed to improve water quality sizing to capture and treat 90% of the average annual stormwater runoff volume. The WQv is directly related to the amount of impervious cover created at a site. The average rainfall storm depth for 90% of storms in New York State in one year is used to calculate a volume of runoff. The rainfall depth depends on the location of the site within the state. From this depth of rainfall, the required water quality volume is calculated.

The project is a redevelopment and therefore will comply with the strategies outlined within Chapter 9: Redevelopment Projects of the Design Manual. There are different options to control water quality depending on the redevelopment.

Since the redevelopment results in the creation of additional impervious area, Water Quality Treatment Option II will be utilized which requires treatment for 25% of the existing impervious area, plus 100% of the additional, new impervious area.

The plan proposes that a minimum of 25% of the water quality volume (WQv) from the disturbed area is captured and treated by the implementation of standard practices. When utilizing structural stormwater management practices, these practices should be targeted to treat areas with the greatest pollutant generation potential (e.g. parking areas, service stations, etc).

The NYSDEC Redevelopment Standards include specific criteria for the implementation of surface water quality improvements. A combination of standard and non-standard practices are proposed and all facilities will treat the required water quality volume from the entire contributing area. Therefore, Water Quality Treatment Options II & III will be utilized. According to Option III of the Redevelopment Standards, alternative or non-standard practices such as manufactured treatment devices are acceptable if they treat 75% of the water quality volume from the disturbed areas as well as any additional runoff directed to the practice. According to Option II, standard practices such as subsurface infiltration systems can be sized to treat the water quality volume generated from 25% of the existing impervious area plus 100% of the new impervious area.

Green practices such as green roofs and porous pavement can be used towards credit in meeting the water quality volume requirements.

Proposed standard SMP's will effectively treat 100% of the Water Quality Volume (Wqv) for all existing and new impervious areas and the proposed alternative SMP will treat a portion of the redevelopment area.

#### Step 3: Runoff Reduction Volumes (RRv) by Applying Green Infrastructure Techniques and Standard SMP's

RRv is required for this project since it is a combination of both new development and redevelopment.

Green infrastructure techniques or standard SMP's with RRv capacity can potentially reduce the required WQv by incorporating combinations of green infrastructure techniques and standard SMP's within each drainage area on the site.

Green infrastructure techniques are grouped into two categories:

- Practices resulting in a reduction of contributing area such as preservation/restoration of conservation areas, vegetated channels, etc.
- Practices resulting in a reduction of contributing volume such as green roofs, stormwater planters, and rain gardens.

Apply a combination of green infrastructure techniques and standard SMPs with RRv capacity to provide 100% of the WQv calculated in Step 2. If the RRv calculated in this step is greater than or equal to the WQv in Step 2, the RRv requirement has been met and Step 4 can be skipped. If the RRv provided cannot meet or exceed 100% of the WQv, the project must, at a minimum, reduce a percentage of the runoff from impervious areas to be constructed on the site. The percent reduction is based on the Hydrologic Soil Group(s) (HSG) of the site and is defined as Specific Reduction Factor (S).

The Minimum RRv capacity required must be provided by green infrastructure techniques to verify that the RRv requirement has been met. The RRv that is provided by the green infrastructure techniques can then be subtracted from the Total Required WQv that must be provided by the SMP's.

#### Step 4: Apply Standard Stormwater Management Practices to Address Remaining Water Quality Volume

Apply the standard SMP's to meet additional water quality volume requirements that cannot be addressed by applying the green infrastructure techniques. The standard SMP's with RRv capacity must be implemented to verify that the RRv requirement has been met.

- **Infiltration Practices** – A subsurface infiltration system is proposed to treat and retain runoff from the site. This practice is located in an area where the groundwater elevation is acceptable to provide the required separation. According to Section 3.6 of the Design Manual, 90% of the WQv provided by an Infiltration Practice can be applied towards meeting the RRv criteria.

#### Step 5: Apply Volume and Peak Rate Control Practices to Meet Water Quantity Requirements

The Channel Protection Volume (CPv), Overbank Flood Control (Qp) and Extreme Flood Control (Qf) must be met for the plan to be completed. This is accomplished by using practices such as infiltration basins, dry detention basins, etc. to meet water quantity requirements. The following standards must be met:

##### **1. Stream Channel Protection (CPv)**

Stream Channel Protection Volume Requirements (CPv) are designed to protect stream channels from erosion. In New York State this goal is accomplished by providing 24-hour extended detention of the one-year, 24-hour storm event, remained from runoff reduction. Reduction of runoff for meeting stream channel protection objectives, where

site conditions allow, is encouraged and the volume reduction achieved through green infrastructure can be deducted from CPv. Trout waters may be exempted from the 24-hour ED requirement, with only 12 hours of extended detention required to meet this criterion. Detention time may be calculated using either a center of mass method or plug flow calculation method.

- CPv is not required because reduction of the entire CPv volume is achieved at a site through green infrastructure or infiltration systems.

## **2. Overbank Flood (Qp) which is the 10 year storm.**

Overbank control requires storage to attenuate the post development 10-year, 24-hour peak discharge rate (Qp) to predevelopment rates.

The overbank flood control requirement (Qp) does not apply in certain conditions, including:

- The site discharges directly tidal waters or fifth order (fifth downstream) or larger streams.
- A downstream analysis reveals that overbank control is not needed.
- If redevelopment results in no increase in impervious area or changes to hydrology that increase the discharge rate from the site, the ten year criteria does not apply.

## **3. Extreme Storm (Qf) which is the 100 year storm.**

100 Year Control requires storage to attenuate the post development 100-year, 24-hour peak discharge rate (Qf) to predevelopment rates.

The 100-year storm control requirement can be waived if:

- The site discharges directly tidal waters or fifth order (fifth downstream) or larger streams.
- Development is prohibited within the ultimate 100-year floodplain
- A downstream analysis reveals that 100-year control is not needed.
- If redevelopment results in no increase in impervious area or changes to hydrology that increase the discharge rate from the site the hundred-year criteria does not apply.

Based on the foregoing, this project is eligible for coverage under NYSDEC SPDES General Permit No. GP-0-20-001.

### **III. STUDY METHODOLOGY**

---

Runoff rates were calculated based upon the standards set forth by the United States Department of Agriculture Natural Resources Conservation Service Technical Release 55, Urban Hydrology for Small Watersheds (TR-55), dated June 1986. The methodology set forth in TR-55 considers a multitude of characteristics for watershed areas including soil types, soil permeability, vegetative cover, time of concentration, topography, rainfall intensity, ponding areas, etc.

The 1, 10, 100 year storm recurrence intervals were reviewed in the design of the stormwater management facilities (see Appendices A & B Existing/Proposed Hydrologic Calculations).

Anticipated drainage conditions were analyzed taking into account the rate of runoff which will result from the construction of buildings, parking areas and other impervious surfaces associated with the site development.

## Base Data and Design Criteria

For the stormwater management analysis, the following base information and methodology were used:

1. The site drainage patterns and outfall facilities were reviewed by JMC personnel for the purpose of gathering background data and confirming existing mapping of the watershed areas.
2. An Existing Drainage Area Map was developed from the topographical survey. The drainage area map reflects the existing conditions within and around the project area.
3. A Proposed Drainage Area Map was developed from the proposed grading design superimposed over the topographical survey. The drainage area map reflects the proposed conditions within the project area and the existing conditions to remain in the surrounding area.
4. The United States Department of Agriculture (USDA) Web Soil Survey of the site available on its website at <http://websoilsurvey.nrcd.usda.gov>.
5. Soil Survey of Putnam and Westchester Counties, 1994.
6. The United States Department of Agriculture Natural Resources Conservation Service Technical Report No. 55, Urban Hydrology for Small Watersheds (TR-55), dated June 1986.

The time of concentration was calculated using the methods described in Chapter 3 of TR-55, Second Edition, June 1986. Manning's kinematics wave equation was used to determine the travel time of sheet flow. The 2-year 24-hour precipitation amount of 3.41 inches was used in the equation for all storm events. The travel time for shallow concentrated flow was computed using Figure 3-1 and Table 3-1 of TR-55. Manning's Equation was used to determine the travel time for channel reaches.

7. All hydrologic calculations were performed with the Bentley PondPack software package version 10.0.
8. The New York State Stormwater Management Design Manual, revised January 2015.
9. New York Standards and Specifications for Erosion and Sediment Control, November 2016.
10. The storm flows for the 1, 10, & 100 year recurrence interval storms were analyzed for the total watershed areas. The Type III distribution design storm for a 24 hour duration was used and the mass rainfall for each design storm was taken from the Extreme Precipitation in New York & New England developed by the Natural Resource Conservation Service (NRCS) and the Northeast Regional Climate Center (NRCC) as follows:

#### **24 Hour Rainfall Amounts**

Design Storm Recurrence Interval	Inches of Rainfall
1 Year	<b>2.78</b>
10 Year	<b>5.14</b>
100 Year	<b>9.30</b>

<http://precip.eas.cornell.edu/>

---

#### **IV. EXISTING CONDITIONS**

The existing conditions of the project site consists of the vacant stony lodge psychiatric facility, which contains existing buildings, driveways, grass and wooded areas. Stormwater from the site flows southeast and southwest to existing storm sewer structures that lead off site. After stormwater runoff exits the project site, it flows to existing stormwater conveyance systems in Pershing Avenue.

The following natural features, conservation areas, resource areas and drainage patterns of the project site have been identified and utilized to develop Drawing DA-1 “Existing Drainage Area Map” which is included in Appendix H:

- Vegetative cover
- Critical areas
- Topography (contour lines, existing flow paths, steep slopes, etc.)
- Soil (hydrologic soil groups, highly erodible soils, etc.)
- Bedrock, significant geology features

Based on the USDA web soil survey, all on-site soils are well drained and belong to hydrological group(s) B, C and D. The soil types, boundaries and drainage areas/designations are depicted on Drawing DA-1 within Appendix H.

Three (3) separate Design Points (1 through 3) were identified for comparing peak rates of runoff in existing and proposed conditions. Three (3) separate drainage areas were identified in existing conditions based on the existing drainage divides at the site. The numbers included in the name of each drainage area correspond to the Design Point they drain towards.

The following is a description of each of the drainage areas analyzed in the existing conditions analysis:

Existing Drainage Area 1 is the western portion of the site and discharges to Design Point 1, which is an existing catch basin located in Pershing Avenue. Existing Drainage Area 1 consists of the following sub-drainage areas:

Existing Drainage Area 1A (EDA-1A) is 2.60 acres in size and is located in the north corner of the site adjacent to Croton Dam Road. This area consists of parking areas, driveways, woods and grassed areas. This drainage area initially drains northwest towards an existing depression which acts as a small detention pond and drains south adjacent to croton dam road towards design point one. The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 69 and

14.3 minutes, respectively. Refer to Drawing DA-1 in Appendix H.

Existing Drainage Area 1B (EDA-1B) is 2.31 acres and consist of a portion of the main building, an asphalt parking area, asphalt drives, woods and grass. Runoff from EA-1B flows overland to a depression to the north of the site driveway. The runoff is collected by a drain inlet in the depression and conveyed in a 12" corrugated metal pipe (CMP) to EDA-1C.

The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 74 and 11.4 minutes, respectively. Refer to Drawing DA-1 in Appendix H.

Existing Drainage Area 1C (EDA-1C) is 3.51 acres and consists of a portion of the main building, a 2 story frame building, asphalt drives, a gravel parking area, a few utility buildings, woods and grass. Runoff from EDA-1C flows overland to the southeast corner of the site. The runoff at this location is routed through an existing pipe that extends through the neighboring properties and into the existing catch basin in Pershing Avenue. The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 75 and 8.8 minutes, respectively. Refer to Drawing DA-1 in Appendix H.

Existing Drainage Area 2 is the eastern portion of the site and discharges to Design Point 2, which is an existing structure in the southernmost corner of the site. Existing Drainage Area 2 consists of the following sub-drainage areas:

Existing Drainage Area 2A (EDA-2A) is 2.99 acres and consists of a garage and recreation building, a portion of the North Lodge, asphalt parking areas, asphalt drives, woods and grass. Runoff from EDA-2 flows overland to a wetland in the Village of Ossining. The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 69 and 5.9 minutes, respectively. Refer to Drawing DA-1 in Appendix H.

Existing Drainage Area 2B (EDA-2B) is 5.79 acres and consists of a portion of the North Lodge, the East Lodge, the West Lodge, the South Cottage, the Administration Building, a garage, a 1 ½ story frame building, asphalt walks and drives, woods and grass. Runoff from EDA-2B flows overland to a swale along the rear property line. The Curve Number (CN) and Time of

Concentration (Tc) for this drainage area are 67 and 12.1 minutes, respectively. Refer to Drawing DA-1 in Appendix H.

Existing Drainage Area 3 (EDA-3) is 0.09 acres and consists of a portion of the asphalt drive and grass area adjacent to Croton Dam Road. Runoff from EDA-3 flows overland out to Croton Dam Road. The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 80 and 5 minutes, respectively. Refer to Drawing DA-1 in Appendix H.

The peak rates of runoff to the design points from the drainage areas for each storm are shown in the table below:

**Table 1**  
**Summary of Peak Rates of Runoff in Existing Conditions**  
(Cubic Feet per Second)

Storm Recurrence Interval	DP-1	DP-2	DP-3
1 year	3.65	3.21	0.21
10 year	12.59	15.40	0.39
100 year	26.73	42.32	2.28

## V. PROPOSED CONDITIONS

---

The proposed improvements consist of 98 age-restricted townhouse units including 18 affordable units in clusters of 2, 3, 4, 5 and 6 units, associated sidewalks, parking lot, driveway, subsurface parking garage and landscaped areas. The proposed on-site stormwater runoff from the impervious surfaces including building rooftops, driveway, parking areas and sidewalks will be collected and conveyed by drainage manholes and catch basins to a network of high density polyethylene (HDPE) drain pipe installed underground with discharge to proposed infiltration basins and a micropool extended detention basin.

The proposed drainage improvements include standard stormwater management practices, such as infiltration basins. The vegetated practices and overland discharges provide multiple opportunities for water quality enhancement and infiltration in addition to the proposed stormwater management practices.

This section describes the design and analysis of the proposed conditions used to demonstrate that the SWPPP meets the requirements of the General Permit.

### **The Five Step Process For Stormwater Site Planning and Practice Selection**

#### **Step 1: Site Planning**

The following practices and site features were incorporated in the site design:

- Forest, vegetative cover – The maximum amount of forest and vegetative cover has been maintained and/or provided.
- Topography (contour lines, existing flow paths, steep slopes, etc.) has been maintained or disturbed to the minimum extent practicable.
- Soil (hydrologic soil groups, highly erodible soils, etc.)
- Bedrock, significant geology features have been accounted for.

#### **Step 2: Determine Water Quality Treatment Volume (WQv)**

This initial calculation of WQv must be revised after green infrastructure techniques are applied. The following method has been used to calculate the WQv.

**90% Rule** - According to the New York State Stormwater Design Manual, Section 4.1, the water quality volume is determined by the 90% rule. The method is based on 90% of the average annual stormwater runoff volume which must be provided due to impervious surfaces. The WQv is directly related to the amount of impervious cover created at a site. The rainfall depth depends on the location of the site within the state. From this depth of rainfall, the required water quality volume is calculated.

#### **Step 3: Runoff Reduction Volumes (RRv) by Applying Green Infrastructure Techniques and Standard SMP's**

Handling of the Runoff Reduction Volume (RRv) is required for the project since it is new development. As permitted in the NYS Stormwater Design Manual, green infrastructure techniques and standard stormwater management practices with RRv capacity can be credited towards the required WQv discussed above when implemented in accordance with the Manual.

Green infrastructure techniques are grouped into two categories:

- Practices resulting in a reduction of contributing area such as preservation/restoration of conservation areas, tree planting, riparian buffers, etc.
- Practices resulting in a reduction of contributing volume such as vegetated swales, pervious pavers, bioretention systems and infiltration systems.

Apply a combination of green infrastructure techniques and standard SMPs with RRv capacity to provide 100% of the WQv calculated in Step 2. If the RRv calculated in this step is greater than or equal to the WQv in Step 2, the RRv requirement has been met and Step 4 can be skipped. If the RRv provided cannot meet or exceed 100% of the WQv, the project must, at a minimum, reduce a percentage of the runoff from impervious areas to be constructed on the Site which is referred to as the Minimum RRv. The percent reduction is based on the Hydrologic Soil Group(s) (HSG) of the Site and is defined as Specific Reduction Factor.

The following standard stormwater management practice is provided in the Design Manual:

- **Standard Practices with RRv Capacity**
  - **Infiltration Basins** – Two infiltration systems are proposed to treat and retain runoff from the rooftop of the proposed building, parking areas, driveways and sidewalks. These practices are located in areas where the existing groundwater was identified at a lower depth.

The Minimum RRv capacity required must be provided by green infrastructure techniques or standard practices to verify that the RRv requirement has been met. The RRv that is provided by

the green infrastructure techniques can then be subtracted from the Total Required WQv that must be provided by the SMP's.

Step 4: Apply Standard Stormwater Management Practices to Address Remaining Water Quality Volume

The standard SMP's must be designed to meet additional water quality volume requirements that cannot be addressed by applying the green infrastructure techniques by themselves.

Step 5: Apply Volume and Peak Rate Control Practices to Meet Water Quantity Requirements

All practices exceed the required elements of SMP criteria as outlined in Chapter 6 of the NYS Stormwater Management Design Manual. A summary of each category is provided below.

1. Feasibility – Ponds are designed based upon unique physical environmental considerations noted in the NYS Stormwater Management Design Manual (NYSSMDM) Table 7.2 "Physical Feasibility Matrix".
2. Conveyance – The design conveys runoff to the designed pond in a manner that is safe, minimizes erosion and disruption to natural drainage channel and promotes filtering and infiltration.
3. Pretreatment – All pond provide pretreatment in accordance with NYSSMDM design guidelines.
4. Treatment Geometry – The plan provides water quality treatment in accordance with NYSSMDM guidelines noted Table 6.1 "Water Quality Volume Distributing in Pond Design".
5. Environmental/Landscaping –Extensive landscaping has been provided for each proposed practice to enhance pollutant removal and provide aesthetic enhancement to the property.
6. Maintenance – Maintenance for the environment practices has been provided and is detail in the SWPPP Report as required. Maintenance access is provided in the design plans.

Table 1 summarizes the WQv and RRv required for both design points on the property:

**Table 1**

<b>WQv / RRv Calculations Summary – See Appendix C</b>	
Initial Required WQv	47,571 c.f.
Adjusted Required WQv (Redevelopment)	37,182 c.f.
Minimum RRv Required	12,250 c.f.
RRv Provided	43,308 c.f.
Net WQv Required	0 c.f.

In order to determine the post-development rates of runoff generated on-site, the following drainage areas were analyzed in the post-development conditions. These areas are graphically depicted on Drawing DA-2 "Proposed Drainage Area Map" located in Appendix H.

Three separate Design Points were identified for comparing peak rates of runoff in existing and proposed conditions. Similarly, three separate drainage areas were identified in proposed conditions based on the proposed drainage divides at the site. The numbers included in the name of each drainage area correspond to the Design Point they drain towards.

The following is a description of each of the drainage areas analyzed in the proposed conditions analysis.

Proposed Drainage Area 1 is the western portion of the site and discharges to Design Point 1, which is an existing catch basin located in Pershing Avenue. Proposed Drainage Area 1 consists of the following sub-drainage areas:

Proposed Drainage Area 1A (PDA-1A) is 6.08 acres located at the northwestern portion of the site and consist of the proposed townhouses, driveways, parking areas and landscaping areas. Runoff from PDA-1A will be collected by roof drain leaders and drain inlets and conveyed in pipes to infiltration basin 1A. Stormwater runoff will be pretreated prior to discharging into the infiltration basin with the use of a Cascade Separator water quality structure. The treated water from the

Cascade unit will be routed to the infiltration basin 1A. Multiple infiltration tests were conducted in the area comprising the stormwater basin and revealed infiltration rates ranging from 2-12 inches per hour. To provide a conservative analysis, the average 5 inches per hour was utilized in all infiltration calculations. The outflow for the from the infiltration basin will be conveyed by the outlet control structure OCS-1A which consist of a 3" orifice at elevation 358.75, a 4' weir at elevation 362.20 and the grate top set at elevation 363.10. A 15" culvert pipe is proposed to route the stormwater runoff to the Design Point 1. The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 77 and 5 minutes, respectively.

Proposed Drainage Area 1B (PDA-1B) is 5.82 acres located at the central western portion of the site and consists of a portion of the proposed townhouses, asphalt parking areas, asphalt drives and adjacent landscape areas. Runoff from PDA-1B will be collected by roof drain leaders and drain inlets and conveyed in pipes to infiltration basin 1B. Stormwater runoff will be pretreated prior to discharging into the infiltration basin with the use of a Cascade Separator water quality structure. The treated water from the Cascade unit will be routed to the infiltration basin 1B. Multiple infiltration tests were conducted in the area comprising the stormwater basin and revealed an average rate of 4 inches per hour that was utilized in all infiltration calculations. The outflow from the infiltration basin will be controlled by outlet control structure OCS-1 which consists of an 8" orifice at elevation 343.60 and the grate top set at elevation 347.10. A 15" pipe is proposed to route the stormwater runoff to the Design Point 1. The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 79 and 5 minutes, respectively.

Proposed Drainage Area 1C (PDA-1C) is 0.65 acres in size and consists southern area of the site remaining undeveloped that will continue to be routed through an existing pipe that extends through the neighboring properties and into the existing catch basin in Pershing Avenue. The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 76 and 5 minutes, respectively. Refer to Drawing DA-2 in Appendix H.

Proposed Drainage Area 1D (PDA-1D) is 1.40 acres and consists of the proposed clubhouse building, off street parking, driveway and adjacent landscape areas. Under proposed conditions the

total drainage area and total impervious have been reduced as compared to the existing conditions. Therefore, Water Quality Treatment Options II & III will be utilized. According to Option III of the Redevelopment Standards, alternative or non-standard practices such as manufactured treatment devices are acceptable if they treat 75% of the water quality volume from the disturbed areas as well as any additional runoff directed to the practice. Therefore, the impervious areas will be treated with a Cascade Separator Unit CS-3, which is a NYSDEC approved alternative practice. Runoff from PDA-1D will flow overland to a depression located south of the site driveway. The outflow from the depression will be conveyed to a proposed series of pipes located in Croton Dam Road and then discharge into an existing catch basin in Pershing Avenue. The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 80 and 5 minutes, respectively.:.

Proposed Drainage Area 2A (PDA-2A) is 3.27 in size and located along the easter portion of the site. the drainage area consists of rear roof areas of three buildings, landscape areas and adjacent undisturbed areas. Under the proposed conditions the total drainage area and total impervious have been reduced as compared to the existing conditions. Therefore, Water Quality Treatment Options II & III will be utilized. According to Option III of the Redevelopment Standards, alternative or non-standard practices such as manufactured treatment devices are acceptable if they treat 75% of the water quality volume from the disturbed areas as well as any additional runoff directed to the practice. Therefore, the impervious areas will be treated with a Cascade Separator Unit CS-3, which is a NYSDEC approved alternative practice. Runoff from PDA-2A flows overland to the wetland in the northeast corner of the site, as in existing conditions. The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 70 and 5 minutes, respectively.

Proposed Drainage Area PDA-3A is 0.07 acres and consists of the same portion of the asphalt drive and grass area adjacent to Croton Dam Road as compared to existing conditions. Runoff from PDA-3A flows overland out to Croton Dam Road. The Curve Number (CN) and Time of Concentration (Tc) for this drainage area are 87 and 5 minutes, respectively. Refer to Drawing DA-2 in Appendix H.

The peak rates of runoff to the design point of each of the analyzed drainage areas for each storm are shown on the table below:

**Table 3**  
**Summary of Proposed Peak Rates of Runoff in Proposed Conditions**  
**(Cubic Feet per Second)**

<b>Storm Recurrence Interval</b>	<b>DP-1</b>	<b>DP-2</b>	<b>DP-3</b>
1 year	0.57	1.84	0.11
10 year	2.81	7.44	0.26
100 year	17.70	19.30	0.52

The reductions in peak rates of runoff from proposed to existing conditions are shown on the table below:

**Table 4**  
**Percent Reductions in Peak Rates of Runoff (Existing vs. Proposed Conditions)**  
**(Cubic Feet per Second)**

<b>Design Point</b>	<b>Storm Recurrence Frequency (Years)</b>	<b>Existing Peak Runoff Rate (cfs)</b>	<b>Proposed Peak Runoff Rate (cfs)</b>	<b>Percent Reduction (%)</b>
1	1 year	3.65	0.57	84
	10 year	12.59	2.81	77
	100 year	26.73	17.70	33
2	1 year	3.21	1.84	42
	10 year	15.40	7.44	51
	100 year	42.32	19.30	54
3	1 year	0.21	0.11	47
	10 year	0.39	0.26	33
	100 year	2.28	0.52	77

As demonstrated in Table 4, the proposed stormwater improvements will result in significant reductions of peak rates of runoff for all storms and design points analyzed.

## **VI. SOIL EROSION & SEDIMENT CONTROL**

---

A potential impact of the proposed development on any soils or slopes will be that of erosion and transport of sediment during construction. An Erosion and Sediment Control Management Program will be established for the proposed development, beginning at the start of construction and continuing throughout its course, as outlined in the "New York State Standards and Specifications for Erosion and Sediment Control," dated November 2016. A continuing maintenance program will be implemented for the control of sediment transport and erosion control after construction and throughout the useful life of the project.

The Operator shall have a qualified professional conduct an assessment of the site prior to the commencement of construction and certify that the appropriate erosion and sediment controls, as shown on the Sediment & Erosion Control Plans, have been adequately installed to ensure overall preparedness of the site for the commencement of construction. In addition, the Operator shall have a qualified professional conduct one site inspection at least every seven calendar days and at least two site inspections every seven calendar days when greater than five acres of soil is disturbed at any one time.

Prior to the commencement of construction activity, the owner or operator must identify the contractor(s) and subcontractor(s) that will be responsible for installing, constructing, repairing, replacing, inspecting and maintaining the erosion and sediment control practices included in the SWPPP; and the contractor(s) and subcontractor(s) that will be responsible for constructing the post-construction stormwater management practices included in the SWPPP. The owner or operator shall have each of the contractors and subcontractors identify at least one person from their company that will be responsible for implementation of the SWPPP. This person shall be known as the trained contractor. The owner or operator shall ensure that at least one trained contractor is on site on a daily basis when soil disturbance activities are being performed. The owner or operator shall have each of the contractors and subcontractors identified above sign a copy of the certification statement provided in Appendix H before they commence any construction activity.

## Soil Description

As provided by the United States Department of Agriculture, Soil Conservation Service "Web Soil Survey," soil classifications which exist on the subject site are described below.

Soils are placed into four hydrologic groups: A, B, C, and D. In the definitions of the classes, infiltration rate is the rate at which water enters the soil at the surface and is controlled by the surface conditions. Transmission rate is the rate at which water moves in the soil and is controlled by soil properties. Definitions of the classes are as follows:

- A. (Low runoff potential). The soils have a high infiltration rate even when thoroughly wetted. They chiefly consist of deep, well drained to excessively drained sands or gravels. They have a high rate of water transmission.
- B. The soils have a moderate infiltration rate when thoroughly wetted. They chiefly are moderately deep to deep, moderately well drained to well drained soils that have moderately fine to moderately coarse textures. They have a moderate rate of water transmission.
- C. The soils have a slow infiltration rate when thoroughly wetted. They chiefly have a layer that impedes downward movement of water or have moderately fine to fine texture. They have a slow rate of water transmission.
- D. (High runoff potential). The soils have a very slow infiltration rate when thoroughly wetted. They chiefly consist of clay soils that have a high swelling potential, soils that have a permanent high water table, soils that have a claypan or clay layer at or near the surface, and shallow soils over nearly impervious material. They have a very slow rate of water transmission.

A soil's tendency to erode is also described in the USDA web soil survey. The ratings in this interpretation indicate the hazard of soil loss from unsurfaced areas. The ratings are based on soil erosion factor K, slope, and content of rock fragments. The hazard is described as "slight,"

"moderate," or "SEVERE." A rating of "slight" indicates that little or no erosion is likely; "moderate" indicates that some erosion is likely, that the temporarily unsurfaced / unstabilized during construction may require occasional maintenance, and that simple erosion-control measures are needed; and "SEVERE" indicates that significant erosion is expected, that the roads or trails require frequent maintenance, and that erosion-control measures are needed.

Per the Soil Survey, the following soils listed below are present at the site. Following this list is a detailed description of each soil type found on the property:

<b>SYM.</b>	<b>HYDRO.</b>	<b>SOIL GROUP</b>	<b>DESCRIPTION</b>
ChE	B		<b>Charlton Loam, 25-35% slopes</b>
CsD	B		<b>Chatfield Charlton , very rocky</b>
HrF	D		<b>Hollis-Rock Outcrop Complex, very steep</b>
CrC	B		<b>Charlton Chatfield complex</b>
LcB	A/D		<b>Leicester Loam, 3-8% slopes</b>
PnD	C		<b>Paxton Fine Sandy Loam, 15-25% slopes</b>

#### On-Site Pollution Prevention

There are temporary pollution prevention measures used to control litter and construction debris on site, such as:

- Silt Fence
- Sediment Traps
- Inlet Protection

There will be inlet protection provided for all storm drains and inlets with the use of stone & block drop inlet protection, which keep silt, sediment and construction litter and debris out of the on-site stormwater drainage system.

#### Temporary Control Measures

Temporary control measures and facilities will include silt fences, interceptor swales, stabilized construction entrances, temporary seeding, mulching and sediment traps.

Throughout the construction of the proposed redevelopment, temporary control facilities will be implemented to control on-site erosion and sediment transfer. Interceptor swales, if required, will be used to direct stormwater runoff to temporary sediment traps for settlement. The sediment traps will be constructed as part of this project will serve as temporary sediment basins to remove sediment and pollutants from the stormwater runoff produced during construction.

Descriptions of the temporary sediment & erosion controls that will be used during the development of the site including silt fence, stabilized construction entrance, seeding, mulching and inlet protection are as follows:

1. Silt Fence is constructed using a geotextile fabric. The fence will be either 18 inches or 30 inches high. The height of the fence can be increased in the event of placing these devices on uncompacted fills or extremely loose undisturbed soils. The fences will not be placed in areas which receive concentrated flows such as ditches, swales and channels nor will the filter fabric material be placed across the entrance to pipes, culverts, spillway structures, sediment traps or basins.
2. Stabilized Construction Access consists of AASHTO No. 1 rock. The rock entrance will be a minimum of 50 feet in length by 20 feet in width by 8 inches in depth.
3. Seeding will be used to create a vegetative surface to stabilize disturbed earth until at least 70% of the disturbed area has a perennial vegetative cover. This amount is required to adequately function as a sediment and erosion control facility. Grass lining will also be used to line temporary channels and the surrounding disturbed areas.
4. Mulching is used as an anchor for seeding and disturbed areas to reduce soil loss due to storm events. These areas will be mulched with straw at a rate of 3 tons per acre such that the mulch forms a continuous blanket. Mulch must be placed after seeding or within 48 hours after seeding is completed.
5. Inlet Protection will be provided for all stormwater basins and inlets with the use of stone & block drop inlet protection structures, which will keep silt, sediment and construction debris

out of the storm system. Existing structures within existing paved areas will be protected using Manufactured Insert Inlet Protection inside the structures.

6. Erosion Control Matting will be utilized on slopes and within swales, where applicable, to provide stabilization in advance of vegetation being established. Such matting will be biodegradable to facilitate long term growth of vegetation in swales, on slopes and within stormwater management facilities.
7. Sediments Traps will be used with the permanent SMP's until their contributing areas are stabilized.

The contractor shall be responsible for maintaining the temporary sediment and erosion control measures throughout construction. This maintenance will include, but not be limited to, the following tasks:

1. For dust control purposes, moisten all exposed graded areas with water at least twice a day in those areas where soil is exposed and cannot be planted with a temporary cover due to construction operations or the season (December through March).
2. Inspection of erosion and sediment control measures shall be performed at the end of each construction day and immediately following each rainfall event. All required repairs shall be immediately executed by the contractor.
3. Sediment deposits shall be removed when they reach approximately  $\frac{1}{3}$  the height of the silt fence. All such sediment shall be properly disposed of in fill areas on the site, as directed by the Owner's Field Representative. Fill shall be protected following disposal with mulch, temporary and/or permanent vegetation and be completely circumscribed on the downhill side by silt fence.
4. Rake all exposed areas parallel to the slope during earthwork operations.

5. Following final grading, the disturbed area shall be stabilized with a permanent surface treatment (i.e. turf grass, pavement or sidewalk). During rough grading, areas which are not to be disturbed for fourteen or more days shall be stabilized with the temporary seed mixture, as defined on the plans. Seed all piles of dirt in exposed soil areas that will not receive a permanent surface treatment.

### Concrete Material and Equipment Management

Concrete washouts shall be used to contain concrete and liquids when the chutes of concrete mixers and hoppers of concrete pumps are rinsed out after delivery. The washout facilities consolidate solid for easier disposal and prevent runoff of liquids. The wash water is alkaline and contains high levels of chromium, which can leach into the ground and contaminate groundwater. It can also migrate to a storm drain, which can increase the pH of area waters and harm aquatic life. Solids that are improperly disposed of can clog storm drain pipes and cause flooding. Installing concrete washout facilities not only prevents pollution but also is a matter of good housekeeping at your construction site.

Prefabricated concrete washout containers can be delivered to the site to provide maintenance and disposal of materials. Regular pick-ups of solid and liquid waste materials will be necessary. To prevent leaks on the job site, ensure that prefabricated washout containers are watertight. A self installed concrete washout facility can be utilized although they are much less reliable than prefabricated containers and are prone to leaks. There are many design options for the washout, but they are preferably built below-grade to prevent breaches and reduce the likelihood of runoff. Above-grade structures can also be used if they are sized and constructed correctly and are diligently maintained. One of the most common problems with self-installed concrete washout facilities is that they can leak or be breached as a result of constant use, therefore the contractor shall be sure to use quality materials and inspect the facilities on a daily basis.

Washouts must be sized to handle solids, wash water, and rainfall to prevent overflow. Concrete Washout Systems, Inc. estimates that 7 gallons of wash water are used to wash one truck chute and 50 gallons are used to wash out the hopper of a concrete pump truck.

For larger sites, a below-grade washout should be at least 10 feet wide and sized to contain all liquid and solid waste expected to be generated in between cleanout periods. A minimum of 12-inches of freeboard must be provided. The pit must be lined with plastic sheeting of at least 10-mil thickness without holes or tears to prevent leaching of liquids into the ground. Concrete wash water should never be placed in a pit that is connected to the storm drain system or that drains to nearby waterways.

An above-grade washout can be constructed at least 10 feet wide by 10 feet long and sized to contain all liquid and solid waste expected to be generated in between cleanout periods. A minimum of 4-inches of freeboard must be provided. The washout structures can be constructed with staked straw bales or sandbags double-or triple lined with plastic sheeting of at least 10-mil thickness without holes or tears.

Concrete washout facilities shall not be located within 50 feet of storm drains, open ditches, or water bodies and should be placed in locations that allow for convenient access for concrete trucks. The contractor shall check all concrete washout facilities daily to determine if they have been filled to 75 percent capacity, which is when materials need to be removed. Both above-and below-ground self-installed washouts should be inspected daily to ensure that plastic linings are intact and sidewalls have not been damaged by construction activities. Prefabricated washout containers should be inspected daily as well as to ensure the container is not leaking or nearing 75 percent capacity. Inspectors should also note whether the facilities are being used regularly. Additional signage for washouts may be needed in more convenient locations if concrete truck operators are not utilizing them.

The washout structures must be drained or covered prior to predicted rainstorms to prevent overflows. Hardened solids either whole or broken must be removed and then they may be reused onsite or hauled away for recycling.

Once materials are removed from the concrete washout, a new structure must be built or excavated, or if the previous structure is still intact, inspect it for signs of weakening or damage

and make any necessary repairs. Line the structure with new plastic that is free of holes or tears and replace signage if necessary. It is very important that new plastic be used after every cleaning because pumps and concrete removal equipment can damage the existing liner.

#### Construction Site Chemical Control

The purpose of this management measure is to prevent the generation of nonpoint source pollution from construction sites due to improper handling and usage of nutrients and toxic substances, and to prevent the movement of toxic substances from the construction site.

Many potential pollutants other than sediment are associated with construction activities. These pollutants include pesticides; fertilizers used for vegetative stabilization; petrochemicals; construction chemicals such as concrete products, sealers, and paints; wash water associated with these products; paper; wood; garbage; and sanitary waste.

Disposal of excess pesticides and pesticide-related wastes should conform to registered label directions for the disposal and storage of pesticides and pesticide containers set forth in applicable Federal, State and local regulations that govern their usage, handling, storage, and disposal.

Pesticides should be disposed of through either a licensed waste management firm or a treatment, storage and disposal (TSD) facility. Containers should be triple-rinsed before disposal, and rinse waters should be reused as product.

Other practices include setting aside a locked storage area, tightly closing lids, storing in a cool, dry place, checking containers periodically for leaks or deterioration, maintaining a list of products in storage, using plastic sheeting to line the storage areas, and notifying neighboring property owners prior to spraying.

When storing petroleum products, follow these guidelines:

- Create a shelter around the area with cover and wind protection;
- Line the storage area with a double layer of plastic sheeting or similar material;

- Create an impervious berm around the perimeter with a capacity of 110 percent greater than that of the largest container;
- Clearly label all products;
- Keep tanks off the ground; and
- Keep lids securely fastened.

Post spill procedure information and have persons trained in spill handling on site or on call at all times. Materials for cleaning up spills should be kept on site and easily available. Spills should be cleaned up immediately and the contaminated material properly disposed of. Maintain and wash equipment and machinery in confined areas specifically designed to control runoff.

Thinner or solvents should not be discharged into sanitary or storm systems when cleaning machinery. Use alternative methods for cleaning larger equipment parts, such as high-pressure, high-temperature water washes, or steam cleaning. Equipment-washing detergents can be used, and wash water may be discharged into sanitary sewers if solids are removed from the solution first. (This practice should be verified with the local sewer authority.) Small parts can be cleaned with degreasing solvents, which can then be reused or recycled.

#### Solid Waste Management and Portable Sanitary Management

The purpose of this management measure is to prevent the potential for solid waste such as construction debris, trash, etc. from construction sites due to improper handling and storage. Debris and litter should be removed periodically from the BMP's and surrounding areas to prevent clogging of pipes and structures. All construction material shall be stored in designated staging areas. Roll-off containers shall be placed on site and all empty containers, construction debris and litter shall be placed in the containers.

Portable sanitary units may be utilized on-site or bathrooms will be provided within construction trailers. A sanitation removal company will be hired to pump/remove any sanitary waste. In the event that portable sanitary units are used and then cleaned after being emptied, the rinse water may not be disposed of to the storm drain system. It shall be contained for later disposal if it can't

be disposed of on-site. Remove paper and trash before cleaning the portable sanitary units. The portable sanitary units shall be located away from the storm drain system if possible. Provide over head cover for wash areas if possible. Maintain spill response material and equipment on site to eliminate the potential for contaminants and wash water from entering the storm drain system.

#### Permanent Control Measures and Facilities for Long Term Protection

Towards the completion of construction, permanent sediment and erosion control measures will be developed for long term erosion protection. The following permanent control measures and facilities have been proposed to be implemented for the project:

1. Infiltration Basins will be used to treat the runoff volume generated from the developed area and provide improvement to water quality control. The proposed basins will provide water quality for 90% of the average annual stormwater runoff volume. The water quality volume will be retained and higher storms will be released gradually. Refer to the water quality volume calculations, in Appendix C.
2. Catch Basins will be used to remove some of the coarse sand and grit sediment before entering the drainage system. Each catch basin will be constructed with an 18 inch deep sump.
3. Rip-Rap Energy Dissipators At discharge points from the stormwater drainage system into the stormwater management basins, rip-rap pads consisting of angular rocks will be placed to dissipate velocity and reduce the risk of erosion. The rip-rap pads will be 10 feet wide by 10 feet long.
4. Seeding of at least 70% perennial vegetative cover will be used to produce a permanent uniform erosion resistant surface. The seeded areas will be mulched with straw at a rate of 2 tons per acre such that the mulch forms a continuous blanket.

## **Specifications for Soil Restoration**

Prior to the final stabilization of the disturbed areas, soil restoration will be required for all vegetated areas to recover the original properties and porosity of the soil. Soil Restoration Requirements are provided on Table 7 below:

**Table 7**  
**Soil Restoration Requirements**

Type of Soil Disturbance	Soil Restoration Requirement		Comments/Examples
No soil disturbance	Restoration not permitted		Preservation of Natural Features
Minimal soil disturbance	Restoration not required		Clearing and grubbing
Areas where topsoil is stripped only – no change in grade	HSG A&B	HSG C&D	Protect area from any ongoing construction activities
	apply 6 inches of topsoil	Aerate* and apply 6 inches of topsoil	
Areas of cut or fill	HSG A&B	HSG C&D	Clearing and grubbing
	Aerate and apply 6 inches of topsoil	Apply full Soil Restoration**	
Heavy traffic areas on site (especially) in a zone 5-25 feet around buildings but not within a 5 foot perimeter around foundation walls)	Apply full Soil Restoration (decompaction and compost enhancement)		
Areas where Runoff Reduction and/or Infiltration practices are applied	Restoration not required, but may be applied to enhance the reduction specified for appropriate practices.		Keep construction equipment from crossing these areas. To protect newly installed practice from any ongoing construction activities construct a single phase operation fence area.
Redevelopment projects	Soil Restoration is required on redevelopment projects in areas where existing impervious area will be converted to pervious area.		

\* Aeration includes the use of machines such as tractor-drawn implements with coulters making a narrow slit in the soil, a roller with many spikes making indentations in the soil, or prongs which function like a mini-subsoiler.

\*\* Per "Deep Ripping and De-compaction, DEC 2008."

During periods of relatively low to moderate subsoil moisture, the disturbed subsoils are returned to rough grade and the following full soil restoration steps applied:

1. Apply 3 inches of compost over subsoil.
2. Till compost into subsoil to a depth of at least 12 inches using a cat-mounted ripper, tractor-mounted disc, or tiller, mixing, and circulating air and compost into subsoils.
3. Rock-pick until uplifted stone/rock materials of four inches and larger size are cleaned off the site.

#### **Specifications for Final Stabilization of Graded Areas**

Final stabilization of graded areas consists of the placement of topsoil and installation of landscaping (unless the area is to be paved, or a building is to be constructed in the location).

Topsoil is to be spread as soon as grading operations are completed. Topsoil is to be placed to a minimum depth of six inches on all embankments, planting areas and seeding/sod areas. The subgrade is to be scarified to a depth of two inches to provide a bond of the topsoil with the subsoil. Topsoil is to be raked to an even surface and cleared of all debris, roots, stones and other unsatisfactory material.

Planting operations shall be conducted under favorable weather conditions as follows:

- Permanent Lawns - April 15 (provided soil is frost-free and not excessively moist) to May 15; August 15 to October 15.
- Temporary Lawn Seeding - if outside of the time periods noted above, the areas shall be seeded immediately on completion of topsoil operations with annual ryegrass (Italian rye) at a rate of six pounds per 1,000 square feet. Temporary lawn installation is permitted provided the soil is frost-free and not excessively moist. The permanent lawn is to be installed the next planting season.

On slopes with a grade of 3 horizontal to 1 vertical or greater, and in swales, a geotextile netting or mat shall be installed for stabilization purposes as shown on the Plans. Seeded areas are to be mulched with straw or hay at an application rate of 70-90 pounds per 1,000 s.f. Straw or hay mulch must be spread uniformly and anchored immediately after spreading to prevent wind blowing. Mulches must be inspected periodically and in particular after rainstorms to check for erosion. If erosion is observed, additional mulch must be applied. Netting shall be inspected after rainstorms for dislocation or failure; any damage shall be repaired immediately.

All denuded surfaces which will be exposed for a period of over two months or more shall be temporarily hydroseeded with (a) perennial ryegrass at a rate of 40 lbs per acre (1.0 lb per 1000 square feet); (b) Certified "Aroostook" winter rye (cereal rye) @ 100 lb per acre (2.5 lb/1000 s.f.) to be used in the months of October and November.

Permanent turfgrass cover is to consist of a seed mixture as follows:

(a)           Sunny sites

Kentucky Bluegrass	2.0-2.6 pounds/1000 square feet
Perennial Ryegrass	0.6-0.7 pounds/1000 square feet
Fine Fescue	0.4-0.6 pounds/1000 square feet

(b)           Shady sites

Kentucky Bluegrass	0.8-1.0 pounds/1000 square feet
Perennial Ryegrass	0.6-0.7 pounds/1000 square feet
Fine Fescue	2.6-3.3 pounds/1000 square feet

All plant materials shall comply with the standards of the American Association Of Nurserymen with respect to height and caliper as described in its publication American Standard for Nursery Stock, latest edition.

## **VII. CONSTRUCTION PHASE AND POST-CONSTRUCTION MAINTENANCE**

During the construction phase and following construction of the project, a number of maintenance measures will be taken with respect to the site maintenance. Measures to be taken included the following:

### **1. During Construction**

A comprehensive sediment and erosion control plan will be in place during the construction period. Maintenance measures for sediment and erosion controls will include:

A qualified professional acceptable to the municipality will be hired by the owner or operator to monitor the installation and maintenance of the sediment and erosion control plans. The qualified professional shall report directly to the Engineering Consultant and shall be responsible for ensuring compliance with the design of the sediment and erosion control plans.

The qualified professional so hired will inspect all sediment and erosion control measures at least every seven calendar days. In the event that there has been a variance with the design of the sediment and erosion control measures so that the ability of the measures to adequately perform the intended function is lessened or compromised and/or the facilities are not adequately maintained, the qualified professional shall be required to report such variance to the Engineering Consultant within 48 hours and shall be empowered to order immediate repairs to the sediment and erosion control measures.

The qualified professional will also be responsible for observing the adequacy of the vegetation growth (trees, shrubs, groundcovers and turfgrasses) in newly graded areas and for ordering additional plantings in the event that the established plant materials do not adequately protect the ground surface from erosion.

## **2. Following Construction**

Site maintenance activities on the property will include:

- Grounds maintenance, including mowing of lawns;
- Planting of trees, shrubs and groundcovers; pruning of trees and shrubs;
- Application of fertilizer and herbicides;
- Maintenance of stormwater management area;

Grounds maintenance on the site will be performed by landscaping contractor.

Fertilizer is typically applied twice in the year - once in the spring and once in the fall. The application of fertilizer is usually necessary to maintain healthy lawn growth due to competition for nutrients with trees and shrubs and since the clippings are often removed. It is not recommended that fertilizer be applied during the summer. It is at this time that lawns are typically dormant.

Fertilizers come in three basic types: (1) Organic; (2) Soluble synthetic and (3) Slow release.

Organic fertilizers are derived from plant or animal waste. Since they are heavier and bulkier than other fertilizers, it is necessary to apply a much greater amount at one time. Soluble synthetic fertilizers are predictable with determining the exact impact on a lawn. However more applications are necessary since their effect is often short term. Slow release fertilizers have a high percentage of nitrogen so quantities that need be handled at one time are smaller. Slow release fertilizers will be utilized by the project.

A complete fertilizer contains all three of the primary nutrients - nitrogen (N), phosphorus (P) and potassium in the form of potash (K). Typically, a 3-1-2 ratio of nutrients (N-P-K) is used for lawn applications.

Fertilizer shall be applied by the landscape contractor in accordance with the manufacturer's instructions. The application of fertilizer does require some skill on the part of the operator. Should there be a spill of fertilizer, the landscape contractor shall be required to scrape or vacuum it up. The area will then be watered in accordance with the manufacturer's instructions to ensure that the fertilizer becomes soluble and available to plants and does not run off.

Hudson Park Group LLC will be responsible for the long-term operation and maintenance of the permanent stormwater management practices. The permanent stormwater management practices shall be maintained in accordance with the Maintenance Inspection Checklists provided in Appendix E.

## VIII. CONCLUSION

---

This Preliminary Stormwater Pollution Prevention Plan has been prepared to describe the project's pre and post-development stormwater management improvements and its sediment and erosion control improvements to be utilized during construction. The proposed permanent improvements and the interim improvements to be utilized during construction have been designed in accordance with the requirements of the:

- New York State Department of Environmental Conservation (NYSDEC) SPDES General Permit No. GP-0-20-001, effective January 2020.
- Chapter 168 "Stormwater Management and Sediment and Erosion Control" of the Town of Ossining Code.
- New York State Stormwater Management Design Manual, revised January 2016.

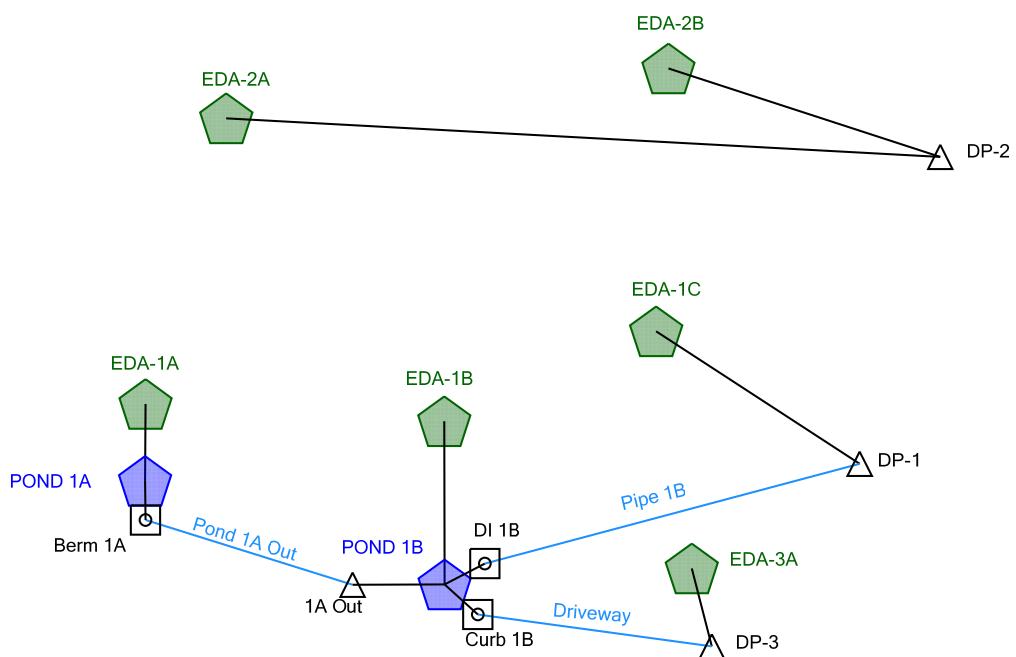

The project employs a variety of practices to enhance stormwater quality and reduce peak rates of runoff associated with the proposed improvements. These measures include infiltration basins, a wet extended detention pond and stormwater planters. These improvements will also mitigate runoff volumes from the proposed improvements as runoff volumes will be slightly reduced or maintained in all the analyzed storms.

Based on the foregoing, it is our professional opinion that the proposed improvements will provide water quantity and quality enhancements which exceed the above mentioned requirements and are not anticipated to have any adverse impacts to the site or any surrounding areas.

Pond Inflow Summary, 100 years (OSSINING-JMC - Synthetic Curve, 100 yrs)	240

## Existing Hydrologic Calculations

### Project Summary

Title RIVER KNOLL  
 Engineer DL  
 Company JMC  
 Date 8/9/2021

### Notes

Subsection: Master Network Summary

### Catchments Summary

Label	Scenario	Return Event (years)	Hydrograph Volume (ft³)	Time to Peak (hours)	Peak Flow (ft³/s)
EDA-1A	OSSINING-JMC - Synthetic Curve, 1 yrs	1	5,241.000	12.200	1.01
EDA-1A	OSSINING-JMC - Synthetic Curve, 10 yrs	10	19,440.000	12.200	4.53
EDA-1A	OSSINING-JMC - Synthetic Curve, 100 yrs	100	51,667.000	12.200	12.16
EDA-2A	OSSINING-JMC - Synthetic Curve, 1 yrs	1	6,027.000	12.100	1.43
EDA-2A	OSSINING-JMC - Synthetic Curve, 10 yrs	10	22,354.000	12.100	6.25
EDA-2A	OSSINING-JMC - Synthetic Curve, 100 yrs	100	59,412.000	12.100	16.66
EDA-2B	OSSINING-JMC - Synthetic Curve, 1 yrs	1	10,076.000	12.200	1.93
EDA-2B	OSSINING-JMC - Synthetic Curve, 10 yrs	10	39,962.000	12.150	9.65
EDA-2B	OSSINING-JMC - Synthetic Curve, 100 yrs	100	109,762.000	12.150	27.40
EDA-1B	OSSINING-JMC - Synthetic Curve, 1 yrs	1	6,472.000	12.150	1.49
EDA-1B	OSSINING-JMC - Synthetic Curve, 10 yrs	10	20,765.000	12.150	5.23
EDA-1B	OSSINING-JMC - Synthetic Curve, 100 yrs	100	51,173.000	12.150	12.80

## Existing Hydrologic Calculations

Subsection: Master Network Summary

### Catchments Summary

Label	Scenario	Return Event (years)	Hydrograph Volume (ft³)	Time to Peak (hours)	Peak Flow (ft³/s)
EDA-1C	OSSINING-JMC - Synthetic Curve, 1 yrs	1	10,447.000	12.150	2.62
EDA-1C	OSSINING-JMC - Synthetic Curve, 10 yrs	10	32,657.000	12.150	8.58
EDA-1C	OSSINING-JMC - Synthetic Curve, 100 yrs	100	79,353.000	12.150	20.39
EDA-3A	OSSINING-JMC - Synthetic Curve, 1 yrs	1	833.000	12.100	0.21
EDA-3A	OSSINING-JMC - Synthetic Curve, 10 yrs	10	1,602.000	12.100	0.39
EDA-3A	OSSINING-JMC - Synthetic Curve, 100 yrs	100	2,960.000	12.100	0.70

### Node Summary

Label	Scenario	Return Event (years)	Hydrograph Volume (ft³)	Time to Peak (hours)	Peak Flow (ft³/s)
DP-1	OSSINING-JMC - Synthetic Curve, 1 yrs	1	16,135.000	12.200	3.65
DP-1	OSSINING-JMC - Synthetic Curve, 10 yrs	10	63,865.000	12.150	12.59
DP-1	OSSINING-JMC - Synthetic Curve, 100 yrs	100	171,927.000	12.150	26.73
DP-2	OSSINING-JMC - Synthetic Curve, 1 yrs	1	16,103.000	12.150	3.21
DP-2	OSSINING-JMC - Synthetic Curve, 10 yrs	10	62,316.000	12.150	15.40
DP-2	OSSINING-JMC - Synthetic Curve, 100 yrs	100	169,174.000	12.150	42.32
DP-3	OSSINING-JMC - Synthetic Curve, 1 yrs	1	833.000	12.100	0.21

## Existing Hydrologic Calculations

## Existing Hydrologic Calculations

Subsection: Time of Concentration Calculations

Return Event: 1 years

Label: EDA-1A

Storm Event: TypeIII 24hr (2.8 in)

Scenario: OSSINING-JMC - Synthetic Curve, 1 yrs

### Time of Concentration Results

#### Segment #1: TR-55 Sheet Flow

Hydraulic Length	10.00 ft
Manning's n	0.011
Slope	0.058 ft/ft
2 Year 24 Hour Depth	3.4 in
Average Velocity	1.37 ft/s
Segment Time of Concentration	0.002 hours

#### Segment #2: TR-55 Sheet Flow

Hydraulic Length	27.00 ft
Manning's n	0.240
Slope	0.105 ft/ft
2 Year 24 Hour Depth	3.4 in
Average Velocity	0.18 ft/s
Segment Time of Concentration	0.042 hours

#### Segment #3: TR-55 Sheet Flow

Hydraulic Length	105.00 ft
Manning's n	0.400
Slope	0.105 ft/ft
2 Year 24 Hour Depth	3.4 in

Time to Flow (Peak Interpolated Output)	12.100 hours
Flow (Peak Interpolated Output)	0.70 ft³/s
<hr/>	
Drainage Area	
SCS CN (Composite)	98.000
Area (User Defined)	0.090 acres
Maximum Retention (Pervious)	0.2 in
Maximum Retention (Pervious, 20 percent)	0.0 in
<hr/>	
Cumulative Runoff	
Cumulative Runoff Depth (Pervious)	9.1 in
Runoff Volume (Pervious)	2,959.740 ft³
<hr/>	
Hydrograph Volume (Area under Hydrograph curve)	
Volume	2,960.000 ft³
<hr/>	
SCS Unit Hydrograph Parameters	
Time of Concentration (Composite)	0.083 hours
Computational Time Increment	0.011 hours
Unit Hydrograph Shape Factor	483.432
K Factor	0.749

## Existing Hydrologic Calculations

Subsection: Unit Hydrograph Summary

Return Event: 100 years

Label: EDA-3A

Storm Event: TypeIII 24hr (9.3 in)

Scenario: OSSINING-JMC - Synthetic Curve, 100 yrs

SCS Unit Hydrograph Parameters	
Receding/Rising, Tr/Tp	1.670
Unit peak, qp	1.22 ft <sup>3</sup> /s
Unit peak time, Tp	0.056 hours
Unit receding limb, Tr	0.222 hours
Total unit time, Tb	0.278 hours

## Existing Hydrologic Calculations

Subsection: Addition Summary

Return Event: 1 years

Label: DP-1

Storm Event: TypeIII 24hr (2.8 in)

Scenario: OSSINING-JMC - Synthetic Curve, 1 yrs

### Summary for Hydrograph Addition at 'DP-1'

Upstream Link	Upstream Node
<Catchment to Outflow Node>	EDA-1C
Pipe 1B	POND 1B

### Node Inflows

Inflow Type	Element	Volume (ft <sup>3</sup> )	Time to Peak (hours)	Flow (Peak) (ft <sup>3</sup> /s)
Flow (From)	EDA-1C	10,447.077	12.150	2.62
Flow (From)	Pipe 1B	5,687.676	12.250	1.38

## Existing Hydrologic Calculations

Subsection: Time vs. Elevation

Return Event: 1 years

Label: POND 1A (OUT)

Storm Event: TypeIII 24hr (2.8 in)

Scenario: OSSINING-JMC - Synthetic Curve, 1 yrs

### Time vs. Elevation (ft)

**Output Time increment = 0.050 hours**

**Time on left represents time for first value in each row.**

Time (hours)	Elevation (ft)	Elevation (ft)	Elevation (ft)	Elevation (ft)	Elevation (ft)

## Existing Hydrologic Calculations

Subsection: Time vs. Volume

Return Event: 10 years

Label: POND 1A

Storm Event: TypeIII 24hr (5.1 in)

Scenario: OSSINING-JMC - Synthetic Curve, 10 yrs

### Time vs. Volume ( $\text{ft}^3$ )

**Output Time increment = 0.050 hours**

**Time on left represents time for first value in each row.**

Time (hours)	Volume ( $\text{ft}^3$ )				
25.750	8,215.000	8,215.000	8,214.000	8,214.000	8,213.000

## Existing Hydrologic Calculations

Subsection: Time vs. Volume

Return Event: 100 years

Label: POND 1B

Storm Event: TypeIII 24hr (9.3 in)

Scenario: OSSINING-JMC - Synthetic Curve, 100 yrs

### Time vs. Volume ( $\text{ft}^3$ )

**Output Time increment = 0.050 hours**

**Time on left represents time for first value in each row.**

Time (hours)	Volume ( $\text{ft}^3$ )				
30.500	784.000	784.000	784.000	784.000	784.000
30.750	784.000	784.000	784.000	784.000	784.000
31.000	784.000	784.000	784.000	784.000	784.000
31.250	784.000	784.000	784.000	784.000	784.000

### Requested Pond Water Surface Elevations

Minimum (Headwater)	338.00 ft
Increment (Headwater)	0.05 ft
Maximum (Headwater)	342.15 ft

### Outlet Connectivity

Structure Type	Outlet ID	Direction	Outfall	E1 (ft)	E2 (ft)
Inlet Box	Riser DI 1B	Forward	Pipe DI 1B	338.48	342.15
Culvert-Circular	Pipe DI 1B	Forward	TW	337.18	342.15
Tailwater Settings	Tailwater			(N/A)	(N/A)

Structure ID: Riser DI 1B

Structure Type: Inlet Box

Number of Openings	1
Elevation	338.48 ft
Orifice Area	9.0 ft <sup>2</sup>
Orifice Coefficient	0.600
Weir Length	12.00 ft
Weir Coefficient	3.33 (ft <sup>0.5</sup> )/s
K Reverse	1.000
Manning's n	0.000
Kev, Charged Riser	0.000
Weir Submergence	False
Orifice H to crest	False

Structure ID: Pipe DI 1B

Structure Type: Culvert-Circular

Number of Barrels	1
Diameter	12.0 in
Length	50.00 ft
Length (Computed Barrel)	50.10 ft
Slope (Computed)	0.064 ft/ft

### Outlet Control Data

Manning's n	0.012
Ke	0.500
Kb	0.027
Kr	0.000
Convergence Tolerance	0.00 ft

### Inlet Control Data

## Proposed Hydrologic Calculations

Subsection: Time vs. Elevation

Return Event: 1 years

Label: BASIN 1A (IN)

Storm Event: TypeIII 24hr (2.8 in)

Scenario: OSSINING-JMC - Synthetic Curve, 1 yrs

### Time vs. Elevation (ft)

**Output Time increment = 0.050 hours**

**Time on left represents time for first value in each row.**

Time (hours)	Elevation (ft)	Elevation (ft)	Elevation (ft)	Elevation (ft)	Elevation (ft)

## Proposed Hydrologic Calculations

Subsection: Time vs. Elevation

Return Event: 10 years

Label: BASIN 1A (IN)

Storm Event: TypeIII 24hr (5.1 in)

Scenario: OSSINING-JMC - Synthetic Curve, 10 yrs

### Time vs. Elevation (ft)

**Output Time increment = 0.050 hours**

**Time on left represents time for first value in each row.**

Time (hours)	Elevation (ft)	Elevation (ft)	Elevation (ft)	Elevation (ft)	Elevation (ft)
30.500	358.00	358.00	358.00	358.00	358.00

## Proposed Hydrologic Calculations

Subsection: Time vs. Elevation

Return Event: 100 years

Label: BASIN 1A (IN)

Storm Event: TypeIII 24hr (9.3 in)

Scenario: OSSINING-JMC - Synthetic Curve, 100 yrs

### Time vs. Elevation (ft)

**Output Time increment = 0.050 hours**

**Time on left represents time for first value in each row.**

Time (hours)	Elevation (ft)	Elevation (ft)	Elevation (ft)	Elevation (ft)	Elevation (ft)
33.250	358.00	358.00	358.00	358.00	358.00

## Proposed Hydrologic Calculations

Subsection: Time vs. Elevation

Return Event: 1 years

Label: Pond 1D (OUT)

Storm Event: TypeIII 24hr (2.8 in)

Scenario: OSSINING-JMC - Synthetic Curve, 1 yrs

### Time vs. Elevation (ft)

**Output Time increment = 0.050 hours**

**Time on left represents time for first value in each row.**

Time (hours)	Elevation (ft)	Elevation (ft)	Elevation (ft)	Elevation (ft)	Elevation (ft)
15.500	315.69	315.69	315.70	315.70	315.70
15.750	315.71	315.71	315.71	315.72	315.72

## Proposed Hydrologic Calculations

Subsection: Time vs. Elevation

Return Event: 100 years

Label: Pond 1D (OUT)

Storm Event: TypeIII 24hr (9.3 in)

Scenario: OSSINING-JMC - Synthetic Curve, 100 yrs

### Time vs. Elevation (ft)

**Output Time increment = 0.050 hours**

**Time on left represents time for first value in each row.**

Time (hours)	Elevation (ft)	Elevation (ft)	Elevation (ft)	Elevation (ft)	Elevation (ft)
33.250	316.02	316.02	316.02	316.02	316.02

## Proposed Hydrologic Calculations

Subsection: Time vs. Volume

Return Event: 100 years

Label: BASIN 1A

Storm Event: TypeIII 24hr (9.3 in)

Scenario: OSSINING-JMC - Synthetic Curve, 100 yrs

### Time vs. Volume (ft<sup>3</sup>)

**Output Time increment = 0.050 hours**

**Time on left represents time for first value in each row.**

Time (hours)	Volume (ft <sup>3</sup> )

## Proposed Hydrologic Calculations

Subsection: Time vs. Volume

Return Event: 10 years

Label: BASIN 1B

Storm Event: TypeIII 24hr (5.1 in)

Scenario: OSSINING-JMC - Synthetic Curve, 10 yrs

### Time vs. Volume ( $\text{ft}^3$ )

**Output Time increment = 0.050 hours**

**Time on left represents time for first value in each row.**

Time (hours)	Volume ( $\text{ft}^3$ )				
10.000	475.000	493.000	512.000	532.000	553.000

## Proposed Hydrologic Calculations

Subsection: Time vs. Volume

Return Event: 100 years

Label: BASIN 1B

Storm Event: TypeIII 24hr (9.3 in)

Scenario: OSSINING-JMC - Synthetic Curve, 100 yrs

### Time vs. Volume ( $\text{ft}^3$ )

**Output Time increment = 0.050 hours**

**Time on left represents time for first value in each row.**

Time (hours)	Volume ( $\text{ft}^3$ )				
12.750	69,487.000	69,690.000	69,850.000	69,968.000	70,045.000

Inflow Type	Element	Volume (ft <sup>3</sup> )	Time to Peak (hours)	Flow (Peak) (ft <sup>3</sup> /s)
Flow (From)	PDA-1A	20,334.676	12.100	5.70
Flow (In)	BASIN 1A	20,334.676	12.100	5.70

## Proposed Hydrologic Calculations

Subsection: Pond Inflow Summary

Return Event: 10 years

Label: BASIN 1A (IN)

Storm Event: TypeIII 24hr (5.1 in)

Scenario: OSSINING-JMC - Synthetic Curve, 10 yrs

### Summary for Hydrograph Addition at 'BASIN 1A'

Upstream Link	Upstream Node
<Catchment to Outflow Node>	PDA-1A

#### Node Inflows

Inflow Type	Element	Volume (ft <sup>3</sup> )	Time to Peak (hours)	Flow (Peak) (ft <sup>3</sup> /s)
Flow (From)	PDA-1A	60,480.008	12.100	17.30
Flow (In)	BASIN 1A	60,480.008	12.100	17.30

Subsection: Pond Inflow Summary

Return Event: 100 years

Label: BASIN 1A (IN)

Storm Event: TypeIII 24hr (9.3 in)

Scenario: OSSINING-JMC - Synthetic Curve, 100 yrs

### Summary for Hydrograph Addition at 'BASIN 1A'

Upstream Link	Upstream Node
<Catchment to Outflow Node>	PDA-1A

#### Node Inflows

Inflow Type	Element	Volume (ft <sup>3</sup> )	Time to Peak (hours)	Flow (Peak) (ft <sup>3</sup> /s)
Flow (From)	PDA-1A	142,984.798	12.100	39.64
Flow (In)	BASIN 1A	142,984.798	12.100	39.64

Subsection: Elevation-Volume-Flow Table (Pond)

Return Event: 1 years

Label: BASIN 1B

Storm Event: TypeIII 24hr (2.8 in)

Scenario: OSSINING-JMC - Synthetic Curve, 1 yrs

#### Infiltration

Infiltration Method (Computed)	Constant
Infiltration Rate (Constant)	0.94 ft <sup>3</sup> /s

#### Initial Conditions

Elevation (Water Surface, Initial)	343.00 ft
Volume (Initial)	0.000 ft <sup>3</sup>
Flow (Initial Outlet)	0.00 ft <sup>3</sup> /s
Flow (Initial Infiltration)	0.00 ft <sup>3</sup> /s
Flow (Initial, Total)	0.00 ft <sup>3</sup> /s
Time Increment	0.050 hours

Subsection: Level Pool Pond Routing Summary

Return Event: 1 years

Label: BASIN 1B (IN)

Storm Event: TypeIII 24hr (2.8 in)

Scenario: OSSINING-JMC - Synthetic Curve, 1 yrs

### Infiltration

Infiltration Method (Computed)	Constant
Infiltration Rate (Constant)	0.94 ft <sup>3</sup> /s

### Initial Conditions

Elevation (Water Surface, Initial)	343.00 ft
Volume (Initial)	0.000 ft <sup>3</sup>
Flow (Initial Outlet)	0.00 ft <sup>3</sup> /s
Flow (Initial Infiltration)	0.00 ft <sup>3</sup> /s
Flow (Initial, Total)	0.00 ft <sup>3</sup> /s
Time Increment	0.050 hours

## Proposed Hydrologic Calculations

Subsection: Level Pool Pond Routing Summary

Return Event: 1 years

Label: BASIN 1B (IN)

Storm Event: TypeIII 24hr (2.8 in)

Scenario: OSSINING-JMC - Synthetic Curve, 1 yrs

### Inflow/Outflow Hydrograph Summary

Flow (Peak In)	6.54 ft <sup>3</sup> /s	Time to Peak (Flow, In)	12.100 hours
Infiltration (Peak)	0.94 ft <sup>3</sup> /s	Time to Peak (Infiltration)	11.950 hours
Flow (Peak Outlet)	0.00 ft <sup>3</sup> /s	Time to Peak (Flow, Outlet)	0.000 hours

Elevation (Water Surface, Peak)	343.55 ft
---------------------------------	-----------

Volume (Peak)	8,111.068 ft <sup>3</sup>
---------------	---------------------------

### Mass Balance (ft<sup>3</sup>)

Volume (Initial)	0.000 ft <sup>3</sup>
Volume (Total Inflow)	22,973.000 ft <sup>3</sup>
Volume (Total Infiltration)	22,973.000 ft <sup>3</sup>
Volume (Total Outlet Outflow)	0.000 ft <sup>3</sup>
Volume (Retained)	0.000 ft <sup>3</sup>
Volume (Unrouted)	0.000 ft <sup>3</sup>
Error (Mass Balance)	0.0 %

***APPENDIX D***

***REPORT ON SUBSURFACE SOIL AND  
FOUNDATION INVESTIGATION***

# CARLIN • SIMPSON & ASSOCIATES

Consulting Engineers  
Geotechnical & Environmental

## MEMO

DATE: 14 December 2016

TO: Mr. Brian Darcy, EIT  
JMC

FROM: Robert B. Simpson, P.E.  
Meredith R. Anke, P.E.

RE: Proposed River Knoll Development  
40 Croton Dam Road  
Ossining, New York

JOB NO: 16-207

In accordance with our proposal dated 7 November 2016, we have performed a Subsurface Soil and Foundation Investigation at the referenced site. The following is a summary of the preliminary geotechnical design recommendations for the proposed stormwater management areas. The recommendations below are considered preliminary in nature and are intended to give guidance in the planning and designing of the new stormwater management system.

We understand that the planned construction will include four (4) new stormwater detention basins. We have been provided with a plan showing the locations of the new basins. During this study, 14 borings (PT-1 through PT-12) and two (2) probes (P-1 and P-2) were performed in the proposed stormwater management areas at the referenced site. The borings and probes were performed at the locations shown on the attached Boring Location Plan. In addition, we inspected two (2) existing monitoring wells (MW-1 and MW-2) that were found in the proposed stormwater management areas on the site. The well locations are also shown on the attached Boring Location Plan. The boring and probe observations are summarized in the following table.

### Preliminary Boring and Probe Observations

Boring or Probe No.	Approximate Ground Surface Elevation	Observed Depth to Groundwater (Elevation)	Seasonal High Groundwater Elevation	Depth to Bottom of Existing Fill (Elevation)	Observed Depth to Bedrock (Elevation)
<b><i>Northwest Basin</i></b>

NE- Not Encountered

NR – Not Recorded

### **Soil Conditions**

1. **Topsoil** – The surface layer in each of the borings, except for PT-7, PT-7A, and PT-8, consists of topsoil, which varies from approximately 0'4" to 0'9" in thickness.
2. **Asphalt** – At the surface in borings PT-7, PT-7A, and PT-8 is asphalt pavement that is approximately 0'2" in thickness.
3. **Existing Fill** – Below the surface layer in borings PT-3 through PT-8 is existing fill that consists of loose to medium dense brown or dark brown coarse to fine SAND, some (to and) Silt, trace (to little) coarse to fine Gravel. Some topsoil and bricks were encountered within the fill at select boring locations. The fill layer continued to depths ranging from 2'0" to 5'0" below the existing ground surface at the boring locations.
4. **Silty Sand with Gravel** – Underlying the surface layers and existing fill in each of the borings are layers of brown, gray, or red brown coarse to fine SAND, little (to and) Silt, trace (to and) coarse to fine Gravel. Ten of the borings were terminated in this stratum at final depths ranging from 5'0" to 17'0" below the ground surface. In the remaining locations, this layer extended to depths ranging from 8'6" to 11'0" beneath the existing ground surface.
5. **Weathered Bedrock** – Borings PT-2, PT-4, PT-10, and PT-12 were terminated at auger refusal on the probable bedrock surface at final depths ranging from 8'6" to 11'0" below the existing ground surface.

### **Groundwater**

- Groundwater was encountered in seven (7) borings and two (2) probes at depths ranging from 3'0" to 14'0" below the existing ground surface. These depths correlate with water levels ranging from approximately elevation +294.5 to elevation +338.0.
- The seasonal high groundwater level was encountered between elevation +298.0 and elevation +355.0 as indicated in the table above.

- The groundwater observations from this study are summarized in the table above.
- We also inspected two (2) existing monitoring wells (MW-1 and MW-2) that were found in the proposed stormwater management areas on the site. The well observations are summarized in the following table.

#### **Monitoring Well Observations**

<b>Monitoring Well No.</b>	<b>Approximate Ground Surface Elevation</b>	<b>Depth to Groundwater (Elevation)</b>	<b>Depth to Bottom of Well (Elevation)</b>
MW-1	+363.0	7'6" (+355.5)	7'6" (+355.5)
MW-2	+343.0	5'0" (+338.0)	6'2" (+336.8)

#### **Permeability Test Results**

- During this investigation, borehole permeability tests were performed at nine (9) of the boring locations at elevations indicated by JMC. The test results are summarized in the following table.

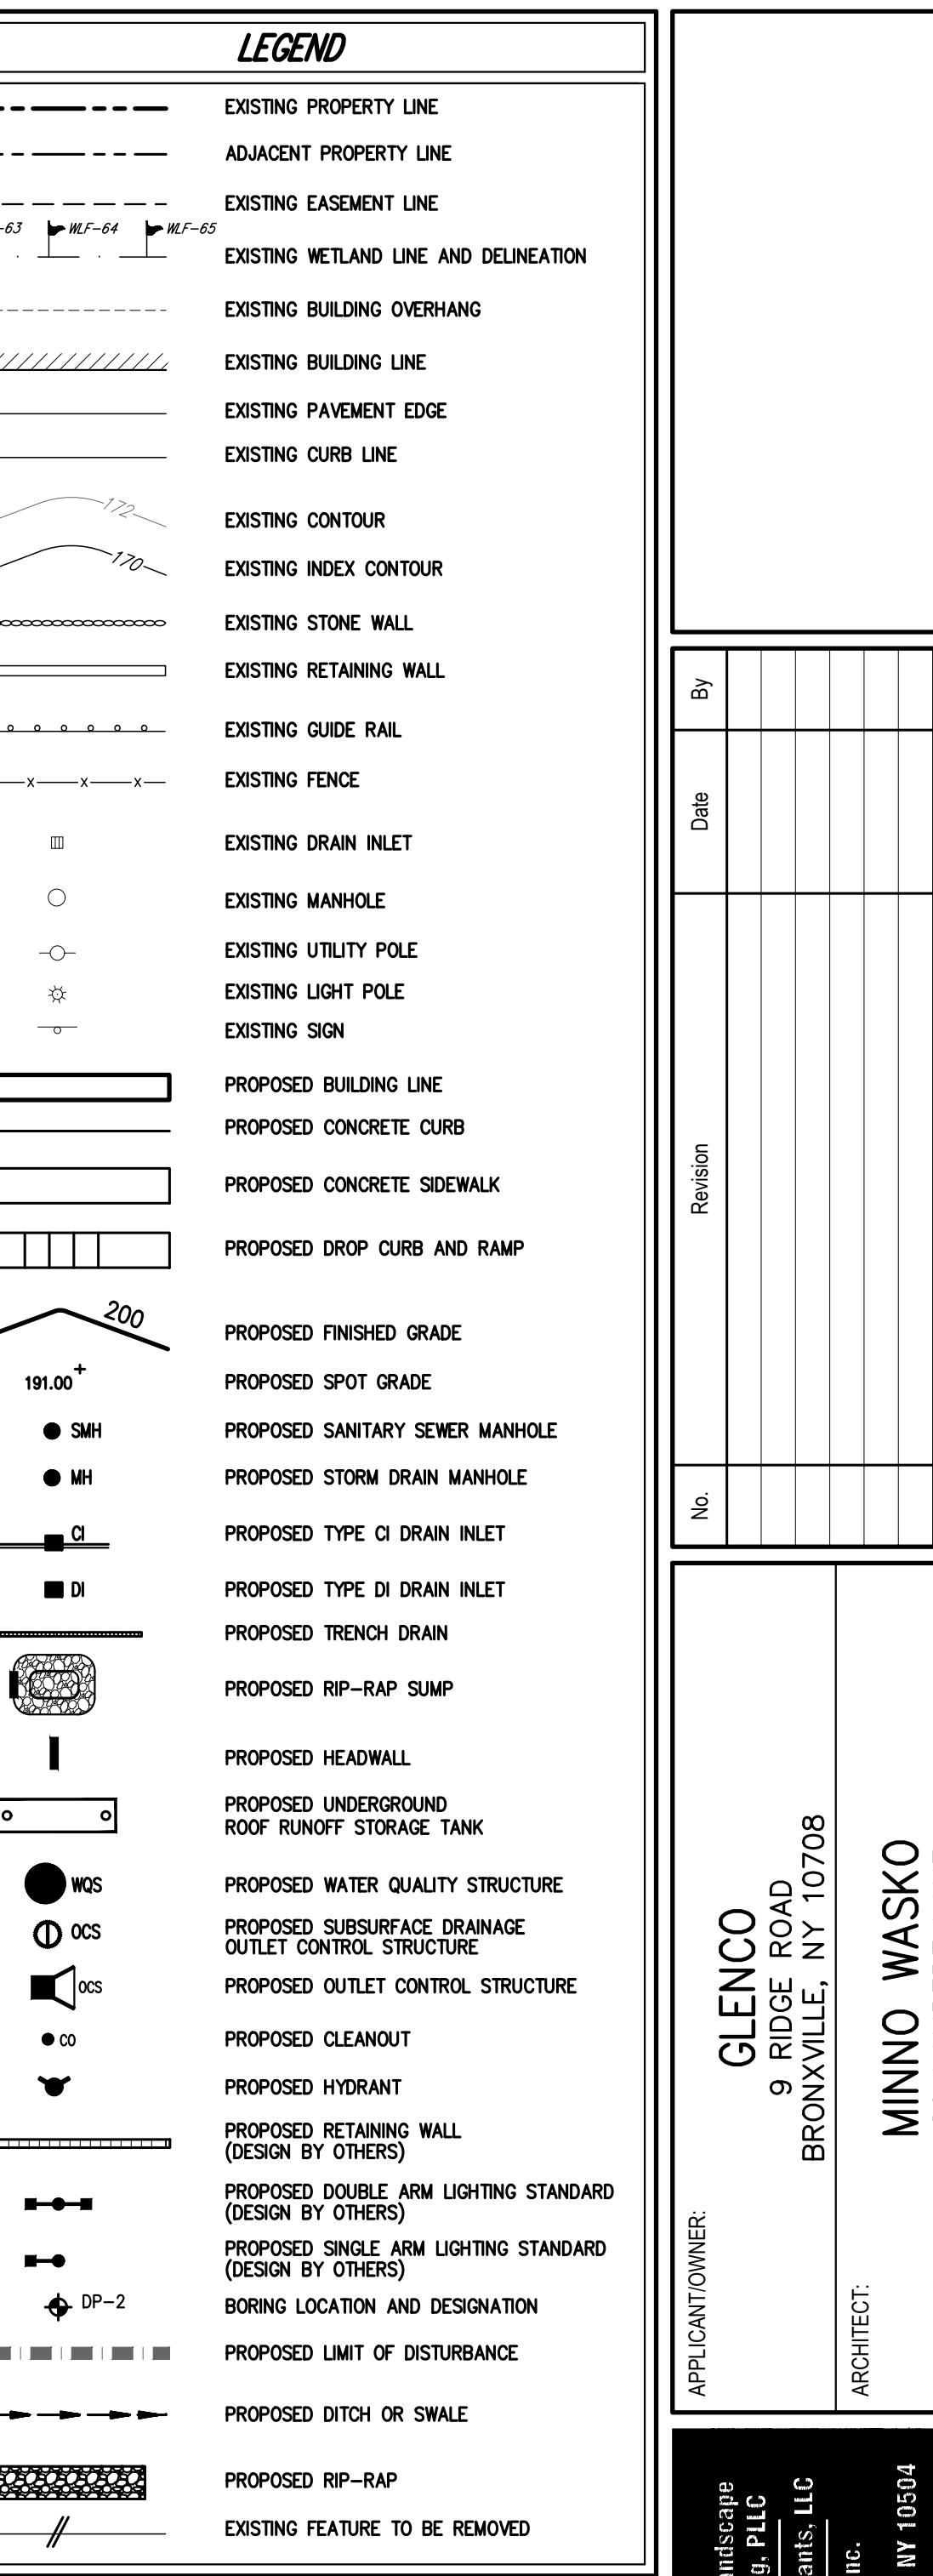

#### **Borehole Permeability Test Results**

<b>Boring No.</b>	<b>Basin Location</b>	<b>Test Depth (Elevation)</b>	<b>Permeability Rate</b>
<b><i>Northwest Basin</i></b>			
PT-1	Northwest	5'6" (+358.0)	2.4 in/hr
PT-2	Northwest	5'6" (+358.0)	12.2 in/hr
PT-2A	Northwest	3'6" (+360.0)	3.6 in/hr
PT-9	Northwest	5'0" (+360.0)	2.5 in/hr
PT-10	Northwest	4'0" (+360.0)	4.3 in/hr
<b><i>Central West Basin</i></b>			
PT-3	Central West	2'0" (+337.0)	0.0 in/hr
PT-11	Central West	3'0" (+342.0)	4.1 in/hr
<b><i>Southeast Basin</i></b>			
PT-7A	Southeast	4'6" (+301.5)	0.0 in/hr
PT-8	Southeast	4'0" (+301.0)	0.0 in/hr

# ***TEMPORARY EROSION AND SEDIMENT CONTROL AND PERMANENT STORMWATER MANAGEMENT PRACTICE INSPECTION AND MAINTENANCE CHECKLISTS***

JMC Project 15064  
 River Knoll  
 40 Croton Dam Road  
 Ossining, NY

**Temporary Erosion and Sediment Control Inspection and Maintenance Checklist**

Erosion and Sediment Control Measure	Inspection/Maintenance Intervals	Inspection/Maintenance Requirements
Stabilized Construction Entrance	Daily	<ul style="list-style-type: none"> <li>• Periodic top dressing with additional aggregate as required</li> <li>• Clean sediment in public right-of-ways immediately</li> </ul>
Silt Fence	Weekly + After Each Rain	<ul style="list-style-type: none"> <li>• Remove &amp; redistribute sediment when bulges develop in the silt fence.</li> </ul>
Inlet Protection	Weekly + After Each Rain	<ul style="list-style-type: none"> <li>• Refer to Figures A5.11, A5.12, A5.13 &amp; A5.14 within the NYSDEC New York State Standard and Specifications for Erosion and Sediment Control</li> </ul>
Stone Check Dam	Weekly + After Each Rain	<ul style="list-style-type: none"> <li>• Correct all damage immediately.</li> <li>• Notify design engineer if significant erosion has occurred between structures as a liner of stone or other suitable material maybe required in this section of the channel.</li> <li>• Remove sediment accumulated behind the dam as needed to allow the channel to drain through the stone check dam and prevent large flows from carrying sediment over the dam.</li> <li>• Replace stones as needed to maintain the design cross section of the structures.</li> </ul>

JMC Project 15064  
River Knoll  
40 Croton Dam Road  
Ossining, NY

**Permanent Stormwater Management Practice Inspection and Maintenance Checklist**

<b>Stormwater Management Practice</b>	<b>Inspection/Maintenance Intervals</b>	<b>Inspection/Maintenance Requirements</b>
Vegetated Swale/Open Channel/Level Spreader	Monthly	<ul style="list-style-type: none"><li>• Check that contributing area is clean of debris.</li><li>• Confirm vegetation is adequately maintained (mowing, fertilizer, etc.)</li><li>• Check for rilling/erosion and repair as needed.</li><li>• Confirm dewatering occurs between storms.</li></ul>
Rip-Rap Apron/Energy Dissipator and Check Dams	Annually + After Major Storms	<ul style="list-style-type: none"><li>• Check for evidence of flows going around the structure.</li><li>• Check for evidence at downstream toe and repair as needed.</li><li>• Clean sediment and install additional aggregate as necessary.</li></ul>
Stormwater Management Basin	Monthly	<ul style="list-style-type: none"><li>• Check Permanent Pool for undesirable vegetative growth and floatings or floatable debris. Remove as needed.</li><li>• Check Forebays for sediment and cleanout when it depth &lt;50% design depth.</li><li>• Check Dry Pond areas for adequate vegetation, undesirable vegetative growth, low flow channels are clear of obstructions, standing water or wet spots and sediment and/or trash accumulation. Repair/remove as necessary.</li></ul>

JMC Project 15064  
 River Knoll  
 40 Croton Dam Road

### **CONTRACTOR'S CERTIFICATION**

"I hereby certify that I understand and agree to comply with the terms and conditions of the SWPPP and agree to implement any corrective actions identified by the qualified inspector during a site inspection. I also understand that the owner or operator must comply with the terms and conditions of the most current version of the New York State Pollutant Discharge Elimination System ("SPDES") general permit for stormwater discharges from construction activities and that it is unlawful for any person to cause or contribute to a violation of water quality standards. Furthermore, I am aware there are significant penalties for submitting false information that I do not believe to be true, including the possibility of time and imprisonment for knowing violations."
