D. TURNING MOVEMENT COUNTS

E. PARKING ANALYSIS

I. INTRODUCTION

This Traffic Study has been prepared to assess existing conditions as well as future traffic operations in association with the proposed Bethany Arts Community redevelopment located at 40 Somerstown Road in the Town of Ossining, NY. The location of the site is illustrated on the figures included in Appendix B.

The proposed redevelopment incorporates the re-utilization of an existing three story building located on the property. The redevelopment proposes a mediation trail around the property as well as 98 parking spaces.

Access to the property is currently provided via a two one-way full movement driveways from Somerstown Road. Site Driveway A is an entrance only driveway while Site Driveway B is an exit only driveway. The applicant proposes to re-utilize the existing driveway locations and reconstruct Site Driveway B to provide two-way traffic with one lane in each direction (entering and exiting traffic).

II. EXISTING CONDITIONS

A. Existing Roadway Network

JMC performed field reconnaissance at the site and adjoining roadway network in order to gather existing conditions data. The field work included a determination of lane widths, striping, horizontal and vertical alignments, signs, speed limits, pedestrian activities, traffic flows, on street parking, sidewalks, curbing, etc.

Somerstown Road (NY 133) is generally an east/west roadway under the jurisdiction of the New York State Department of Transportation (NYSDOT). Somerstown Road provides one travel lane in each direction in the study area. It has a posted speed limit of 35 mph and on-street parking is prohibited within the study area.

In order to evaluate the changes in traffic associated with the proposed redevelopment, the following intersections have been analyzed:

1. Somerstown Road & Site Driveway A
2. Somerstown Road & Site Driveway B

The intersection of Somerstown Road and Site Driveway A is a three-legged unsignalized intersection. The Somerstown Road approaches provide one through lane with shared turning movements in both directions. Site Driveway A is an entrance only driveway into the subject property.

Site Driveway B intersects Somerstown Road at a three-legged unsignalized intersection. The Somerstown Road approaches provide one through lane in both directions. Site Driveway B is an exit only driveway which provide one travel lane with shared turning movements onto Somerstown Road. Under proposed conditions, Site Driveway B will provide two-way traffic and Somerstown Road will provide shared turning movements into the site driveway via the existing travel lanes.

B. Existing Volumes

Traffic counts were performed at the studied intersections in order to quantify and analyze existing peak hour volumes as well as to establish base conditions for projecting future operations. The counts included pedestrian activities and truck traffic.

Traffic counts were conducted from 7:00 – 9:00 AM and 4:00 – 6:00 PM for the Site Driveway A intersection on Thursday, July 21, 2016. The Site Driveway A intersection were also counted from 11:00 – 2:00 PM and 6:00 – 9:00 PM on Saturday, July 23, 2016. This study analyzes four different peak hours which include peak weekday AM, weekday PM hours, Saturday midday as well as a peak Saturday PM hour. The peak hour volumes occurred between 7:15-8:15 AM during the weekday morning, 4:30-5:30 PM during the weekday PM, 12:45-1:45 PM during the Saturday midday, and 6:45-7:45 PM during the

Saturday PM. The intersection traffic count data is included in Appendix D.

There was no traffic volume entering or exiting the subject property. The peak hour volumes are shown on Figures 1 through 4 "2016 Existing Volumes". All figures are included in Appendix B.

Our office also requested accident reports for the studied intersections for the last three years. There was only one accident which occurred at Site Driveway A. The accident involved a distracted driver who was attempting to remove a cobweb from the passenger side of their vehicle which caused them to swerve and hit a mailbox. The accident report data has been tabulated and depicted in Table AR1 located in Appendix A.

C. **Intersection Analysis Methodology**

The intersections have been analyzed based on the methodologies of the 2010 Highway Capacity Manual. Information derived from the manual relative to the level of service criteria is provided below.

1. **Level of Service for Unsignalized Intersections**

The Levels of Service (LOS) for Two Way Stop Control (TWSC) and All Way Stop Control (AWSC) intersections are determined by the computed or measured control delay and are defined for each minor movement. LOS is not defined for the intersection as a whole for TWSC intersections. LOS criteria are presented below.

<i>Unsignalized Level of Service Criteria</i>	
Level of Service	Delay Range (Seconds/Vehicle)
A	≤ 10
B	>10 and ≤ 15
C	>15 and ≤ 25
D	>25 and ≤ 35
E	>35 and ≤ 50
F	>50

Average control delay less than 10 seconds/vehicle are defined as LOS A. Follow-up times of less than 5 seconds/vehicle have been measured when there is no conflicting traffic, so control delays of less than 10 seconds/vehicle are appropriate for low flow conditions.

The LOS criteria for unsignalized intersections are somewhat different than the criteria used for signalized intersections. The primary reason for this difference is that drivers expect different levels of performance from different kinds of transportation facilities. A number of driver behavior considerations combine to make delays at signalized intersections less onerous than delays at unsignalized intersections. For example, drivers at signalized intersections are able to relax during the red interval, whereas drivers on the minor approaches to unsignalized intersections must remain attentive to the task of identifying acceptable gaps and vehicle conflicts. Also, there is often much more variability in the amount of delay experienced by individual drivers at an unsignalized intersections versus that at signalized intersections. For these reasons, it is considered that the control delay threshold for any given LOS would be less for an unsignalized intersection than it would be for a signalized intersection.

D. Existing Operations

The intersection capacity analyses based on existing volumes and conditions are shown on Tables 2 through 5. The specific volume/capacity ratios, delay for average vehicle in seconds and the associated levels of service are summarized for each lane group as applicable on Tables 2 through 5. All tables are included in Appendix A.

The studied intersections operate at a level of service A since there were no traffic volumes turning into or out of the property.

III. PROJECTED CONDITIONS

A. No-Build Volumes

In order to project future traffic increases to the 2021 design year, the existing volumes were increased by a general growth rate of 1% per year compounded annually. Based on discussions with the Town's Building Inspector, we have incorporated the traffic volumes associated with the potential Highview Farms development located at on Tavano Road which is a 24 Lot subdivision. The resulting 2021 no-build volumes represent traffic operations in 2021 without the redevelopment of the site.

Under no-build conditions, the intersections operate at the same levels of service as existing conditions.

B. Build Volumes

The projected traffic associated with the proposed redevelopment is based on information published by the Institute of Transportation Engineers (ITE) in its publication "Trip Generation Manual, 9th Edition." Table 1 shows the traffic volumes associated with the proposed redevelopment.

The net additional driveway volumes were routed through the studied intersections based on existing traffic volumes as well as consideration of the arrival & departure patterns of the site traffic. Adding the proposed redevelopment related traffic results in 2021 Build Volumes which reflect projected volumes after the completion of the redevelopment.

C. Sight Distance

Additionally, our office reviewed the egress site driveway location as it relates to sight distances. Tables S-1 and S-2 contained in Appendix A depict the observed travel speeds on Somerstown Road as well as the posted and 85th percentile speed. The tables calculate the desirable stopping and intersection sight distances based on the 85th percentile speed. The sight distance calculations are based on information contained in the American Association of State Highway and Transportation Officials (AASHTO) publication “A Policy on Geometric Design of Highways and Streets, 6th Edition” which is utilized by the New York State Department of Transportation. For the vehicles turning right out of the site, the available sight distance can accommodate the desirable intersection sight distance. For vehicles turning left out of the site, there is existing trees/vegetation within the State’s right-of-way which encroaches into the sight distance. In order to achieve the intersection sight distance, the existing vegetation/trees located between Site Driveway B and Tavano Road on the east side of Somerstown Road should be removed/trimmed. If the vegetation is not removed/trimmed, we would recommend that left turns out of the driveway be prohibited.

D. Parking

Our office performed a shared parking analysis as it relates to the proposed uses for the proposed redevelopment. The development proposes uses which have varying hours of peak parking demand. The site plan proposes 98 parking spaces for the various uses on the property. The shared parking analysis incorporates the proposed uses and considers that the proposed uses have different parking demands during different times which allows for parking spaces to be utilized for two different uses during different times of the day. In our parking analysis, we assumed the proposed community center and museum uses as an office

use since it would be representative of their parking demands. Our shared parking analysis is contained within Appendix E. Based on our analysis, the peak parking demand on a weekday is 80 parking spaces and on a weekend the demand is 82 parking spaces. Since the redevelopment proposes 98 parking spaces, the redevelopment can accommodate the shared parking demand mentioned in our analysis.

IV. FINDINGS & CONCLUSION

Intersection capacity analysis computed based on the Build Volumes indicate that the intersections will essentially operate at the same levels of service as projected for the No-Build Volumes. Projected operations with the proposed redevelopment are shown on Tables 2 through 5.

Site Driveway B is projected to operate at a level of service B during all studied peak hours except for the peak Saturday PM hour which is projected to operate at a level of service A. Somerstown Road is projected to operate at a level of service A during all studied hours at both site driveways.

Based on the above, it is the professional opinion of JMC that the redevelopment of the site will not have a significant impact on traffic operations in the study area.

Respectfully submitted,

JMC Planning Engineering Landscape Architecture & Land Surveying, PLLC
